foreign countries, this inspection being for quality, condition, and grade, and to serve as the basis for an official certificate. The bulk of grain is now sold on the certificate of inspectors employed by boards of trade and similar agencies, and there is frequently a lack of uniformity in these certificates for similar lots. Questions arise as to the accuracy of the certificate and the condition and deterioration in transit, out of which dissatisfaction has grown which has affected our foreign trade.

The result of consideration of this matter was that the Secretary of Agriculture was authorized "to establish at such points of export as he may deem expedient, laboratories for the purpose of examining and reporting upon the nature, quality, and condition of any sample, parcel, or consignment of seed or grain." The amount named for this purpose was $15,000, which will obviously provide only quite limited facilities for such inspection, but will afford a court of appeal in doubtful or disputed cases. This is doubtless one of the features which will grow in extent as its importance and usefulness are realized, and may ultimately assume considerable proportions.

It will thus be apparent that the Department is adding to its administrative and investigational functions extensive and important inspection work, which is broadened to include not only the special interests of the farmers but the people as a whole.

33747—No. 11—06——2

RECENT WORK IN AGRICULTURAL SCIENCE.

AGRICULTURAL CHEMISTRY.

Introduction to the investigation of products important in agriculture, C. BÖHMER (*Anleitung zur Untersuchung landwirtschaftlich wichtiger Stoffe. Berlin: Paul Parey, 1906, pp. VIII+135*).—This book is intended as a guide for students and teachers in agricultural-chemical laboratories.

The methods described are in the main those approved by the International Congress of Applied Chemistry and of the Association of German Agricultural Experiment Stations. The topics treated are mechanical analysis of soils; examination of commercial fertilizers, including methods of determining phosphoric acid, nitrogen, potash, and lime; examination of feeding stuffs; determination of the sugar content of beets; milk examination; chemical analysis of soils, including preparation of hydrochloric-acid solutions and their examination, fusion with alkaline carbonates and reduction by means of hydrofluoric-acid, and the determination of nitrogen; and preparation of solutions used in analysis.

Equilibrium between some bases when they are present simultaneously with phosphoric acid, A. QUARTAROLI (*Gaz. Chim. Ital., 35 (1905), II, pp. 290–304; Staz. Sper. Agr. Ital., 38 (1905), No. 7–8, pp. 639–657; abs. in Jour. Soc. Chem. Indus., 24 (1905), No. 23, p. 1229*).—The author reports studies of the conditions of equilibrium in the following systems: (1) $1H_3PO_4 + \frac{1}{2}CaO$ (or BaO) + 2KOH (or NaOH); (2) $1H_3PO_4 + \frac{1}{2}CaO$ (or BaO) + 1NaOH; (3) $1H_3PO_4 + \frac{1}{2}MgO$ + 2NaOH (or KOH); (4) $1H_3PO_4 + \frac{1}{2}MgO + 1NaOH$ (or KOH).

In the experiments which are reported 25 cc. of a normal solution of phosphoric acid was mixed with corresponding amounts of the alkaline solutions and the whole made up to 500 cc. An aliquot of the solution was filtered immediately and the filtrate titrated with twice-normal hydrochloric acid in presence of methyl orange and phenolphthalein. After standing for 2 days another portion of the solution was filtered and titrated in the same way.

"In system (1) barely one-third of the phosphoric acid present is precipitated, in the form of tri- and tetrabasic salts, and not two-thirds in the form of a double salt $Ca_3(Ba_3)Na_6(PO_4)_4$, as Berthelot stated. Two-thirds of the phosphoric acid remains in solution in the form of tri- and di-basic salts. The bases are distributed irregularly between the precipitate and the solution. If the system $1H_3PO_4 + \frac{1}{2}BaO$ + 2NaOH be allowed to stand for a long time, the precipitate ultimately contains one atomic proportion each of sodium and barium, and nearly one-half of the acid is precipitated. In system (2) also, the bases are distributed irregularly between the precipitate and the solution. The latter contains mono- and dibasic phosphates, whilst the precipitate contains di-, tri-, and, occasionally, tetrabasic salts. Less than two-thirds of the phosphoric acid is precipitated.

"Magnesia behaves differently from lime and baryta, and its behavior depends also on the kind of alkali present. For example, in system (3) when the alkali employed is sodium hydroxid, the precipitate consists solely of magnesium compounds, whilst when potassium hydroxid is used, some alkali is carried down by the precipitate. In system (4) much less phosphoric acid is precipitated (only about

one-sixth of the total quantity); apparently a soluble double phosphate is formed, as dimagnesium phosphate is insoluble, and the amount of alkali present would be sufficient for the precipitation of the remaining dissolved magnesium under ordinary conditions."

The reactions of the three phosphoric acids, C. Arnold and G. Werner (*Chem. Ztg., 29 (1905), No. 104, pp. 1326, 1327; Analyst, 31 (1906), No. 360, pp. 92, 93*).—The authors' tests of published reactions having shown them to be generally unreliable, a new series of tests with the alkali salts of ortho-, pyro-, and metaphosphoric acids is given.

On the compounds of pyrophosphoric acid, J. Cavalier (*Compt. Rend. Acad. Sci. [Paris], 142 (1906), No. 15, pp. 885–887*).—Four series of salts of this acid, which is taken to be tetrabasic ($P_2O_7H_4$), are briefly described. Studies of the vapor densities of a series of alcoholic pyrophosphates show that they have a molecular weight corresponding closely with the formula $P_2O_7R_4$.

On the determination of citric-acid soluble phosphoric acid in Thomas slag, H. Fresenius (*Landw. Vers. Stat., 64 (1906), No. 1, pp. 12–15*).—A brief review is given of studies of this method.

The determination of phosphoric acid in fertilizers as phosphomolybdic anhydrid, G. Berju (*Jour. Landw., 54 (1906), No. 1, pp. 31–46; abs. in Chem. Ztg., 30 (1906), No. 24, Repert. No. 7, p. 94*).—This article reports a study of the accuracy of Neumann's method[a] as applied to pure phosphates and Thomas slag solutions prepared in various ways. The method is reported to have given accurate results under all conditions and is much simpler and more accurate than direct precipitation of phosphoric acid as magnesium-ammonium phosphate.

The determination of ammoniacal nitrogen in ammoniated superphosphates, Scheele and von Soxhlet (*Landw. Vers. Stat., 64 (1906), No. 1, pp. 15–17*).—A brief account is here given of the discussion of methods for this purpose at the Munich meeting of the Association of German Agricultural Experiment Stations.

A simple method for the determination of nitric acid in nitrates, J. T. Bornwater (*Chem. Weekbl., 3 (1906), pp. 30, 31; abs. in Chem. Centbl., 1906, I, No. 8, p. 703*).—In the method proposed the nitrate is reduced by means of potash solution and aluminium foil and the ammonia distilled in a Kjeldahl apparatus.

On the need of uniform methods of titration in the determination of nitrogen, B. Schulze (*Landw. Vers. Stat., 64 (1906), No. 1, pp. 35, 36*).—A brief account of the discussion of this subject at the Munich meeting of the Association of German Agricultural Experiment Stations, calling attention to lack of uniformity in kind and strength of acids and alkalis used and of the desirability of greater uniformity in these respects.

The determination of potash by means of perchloric acid (*Landw. Vers. Stat., 64 (1906), No. 1, pp. 6, 7*).—This method is described and its unanimous adoption by the Association of German Agricultural Experiment Stations is recorded.

The detection and determination of chlorate in sodium nitrate, L. Grimbert (*Jour. Pharm. et Chim., 6. ser., 23 (1906), pp. 98–100; abs. in Analyst, 31 (1906), No. 361, p. 128*).—Sodium nitrate is tested for presence of chlorate by shaking up the solution with 1 drop of anilin, and pouring a little strong sulphuric acid down the side of the tube. If chlorate is present an intense blue zone appears at the junction of the liquids. Chlorate is determined quantitatively by igniting the nitrate with a little cane sugar, extracting with water, and titrating for chlorids in the usual way.

On the gravimetric determination of calcium, O. Brunck (*Ztschr. Analyt. Chem., 45 (1906), No. 2, pp. 77–87, fig. 1*).—Comparisons of various methods—direct weighing, weighing as carbonate, sulphate, and fluorid—of determining lime are reported. Direct weighing gave the most unsatisfactory result—generally too high.

[a] Ztschr. Analyt. Chem., 37 (1898), p. 317.

The other three methods gave closely agreeing results and were about equally satisfactory. The fluorid method is probably the quickest and most satisfactory in the hands of beginners. For control purposes it is recommended to weigh first as carbonate and then convert into sulphate or fluorid.

Determination of lime in soils, D. J. Hissink (*Chem. Weekbl., 3 (1906), pp. 73–78; abs. in Chem. Centbl., 1906, I, No. 11, p. 961*).—Neubauer's method is recommended.

The analysis of foods. Simple and easy methods of detecting adulteration of food products and other domestic articles, C. Margeot (*L'analyse des aliments. Recettes simples et faciles pour découvrir toutes les falsifications des produits alimentaires et autres objets domestiques. Paris: E. Flammarion, pp. 188*).—As the subtitle states, this volume gives simple directions for the detection of adulteration of food products and other materials used in the home. The descriptive matter includes standards of quality of staple articles of food, the principal methods of adulteration and sophistication which are likely to occur, and methods of detection of adulteration.

The use of the immersion refractometer in food analysis, J. Hanuš and K. Chocenský (*Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 6, pp. 313–320, fig. 1*).—The experimental data described show that the immersion refractometer may be used to determine the amount of caffein present in aqueous solution quickly and accurately.

Maple sirup and maple sugar investigations with particular reference to the detection of adulteration, C. H. Jones (*Vermont Sta. Rpt. 1905, pp. 315–339*).—A number of samples of maple sugar and sirup, maple cream, and brown sugars were examined with special reference to the amount and character of the ash present, the malic acid value, the amount of precipitate obtained with lead subacetate, and other characteristics, the object of the investigations as a whole being the detection of adulteration, particularly with cane and beet sugar products.

According to the author, the minimum standards which seem warranted when applied to a filtered sirup weighing 11 lbs. to the gallon are not less than 0.50 per cent total ash, not less than 0.15 per cent insoluble ash, not less than 0.40 per cent malic acid value, nor less than 1.00 cc. for the lead subacetate precipitate.

If an examination of an original sample shows that one or all of such salient factors are below the minimum, the samples should be boiled to a uniform basis of concentration and filtered. It would seem, the author states in effect, that a certain minimum amount of ash can not be removed from pure maple sirup or maple sugar made into sirup, by the ordinary methods of filtration, and that even slow and complete filtering fails to remove sufficient ash from the pure goods to admit even a suspicion of adulteration.

The ash of pure maple goods consists largely of carbonates of potassium and lime with relatively small and varying quantities of sulphates and phosphates. The determination of the sulphates, according to the author, is of use at times in detecting adulteration since they are present in relatively large amounts in many commercial brown, cane, and beet sugars.

"The amounts of lime and potash also afford data useful in judging the purity of suspected samples. Owing to the work involved these determinations are needful only in important cases when other tests do not furnish convincing data.

"It has been observed that the percentage of sulphates appears to be greater in maple sirup than in maple sugar, although no explanation has been offered. In the writer's opinion, it may be accounted for as follows: The percentage of ash, soluble in water, is greater in sirups than in sugars. . . . This is due entirely to the larger quantity of malate of lime (insoluble ash) in the sugar. As sulphates are found largely in the soluble ash, they would therefore average greater on an ash basis in sirups than in sugars.

"The author has yet to see a pure maple sirup that, even after souring or long keeping under any reasonable conditions, will not furnish an abundant maple aroma on boiling after dilution with water. The flavor or taste of maple goods may serve in a measure to indicate their purity. Inasmuch as many pure maple sirups, particularly those produced in certain sections of the country, have what might be termed a 'molasses taste,' it is best not to form hasty opinions from this sense alone, especially if the origin, age, and conditions of manufacture are not known. The flavor taken into consideration with color is a good criterion as to quality of maple products." (For earlier work see E. S. R., 17, p. 219).

The examination of honey, H. Matthes and F. Mueller (*Ber. Nahrmtl. Untersuch. Amt. Jena, 1903–4, pp. 37–45; abs. in Ztschr. Untersuch. Nahr. u. Genussmtl., 9 (1905), No. 12, pp. 739–741*).—Detailed directions are given for determining the different constituents and constants desirable in an analysis of honey, a feature of the work being the recommendation that a uniform solution of honey be used in every case. The author prepares the solution by dissolving 5 gm. of warm well-mixed honey in 50 gm. of warm water and then diluting to 150 gm. The results of the analyses are all expressed on the dry-matter basis.

Concerning starch, glycogen, and cellulose, Z. H. Skraup (*Monatsh. Chem., 26 (1905), No. 11, p. 1415; abs. in Zentbl. Physiol., 20 (1906), No. 1, pp. 1, 2*).—The chlorazetyl products of starch, glycogen, and cellulose were made by treatment with acetic-acid anhydrid saturated with hydrochloric acid.

From the chlorin content of the bodies formed it is possible to secure data regarding molecular weight. The calculated molecular weight for soluble starch was 7,440, which implies that the starch formula is 46 to 50 times $C_6H_{10}O_5$. The calculated molecular weight for glycogen was 23,630, which would imply a very complicated molecular structure. The values obtained for cellulose from filter paper indicate that the formula is not higher than for soluble starch, perhaps $(C_6H_{10}O_5)_{34}$.

Chemistry of the albumens, S. B. Schryver (*Philadelphia: P. Blakiston's Son & Co., 1906; rev. in Jour. Amer. Chem. Soc., 28 (1906), No. 5, pp. 658–660*).—The present knowledge of the chemistry of proteids is summarized.

"Facts relating to the solubility, physical properties, precipitation by salts, coagulation, behavior toward acids and bases, etc., which have, in the past, formed so large a part of the accounts that have been written of these bodies occupy in this book but a very insignificant place. This fact shows the great progress made during the past five years in our knowledge of the chemical side of this subject, for it is now possible to give a condensed account of the purely chemical facts that are known which is sufficiently extensive to warrant their publication in a separate volume."

A considerable part of the volume is taken up with the chemistry of the nucleic acids and their decomposition products, especially the purin and pyrimidin bodies, which bear no chemical relation to the protein molecule proper. "The only reason for including the nucleic acids is the fact that they are always found in nature together with the proteins or the protamins. This practice, while convenient for those familiar with the proteins, leads to confusion among those who take only a general interest and read such books as the one under consideration in order to obtain a general knowledge of the chemistry of the proteins."

Crude gluten, F. A. Norton (*Jour. Amer. Chem. Soc., 28 (1906), No. 1, pp. 8–25*).—According to the author's investigations "crude gluten consists of about 75 per cent of true gluten—gliadin and glutenin—together with small percentages of nongluten proteid, mineral matter, fat, starch, fiber, and other nonproteid matter.

"The relation of the crude gluten content to that of total protein ($N \times 5.7$) varies with the character of the flour, the crude gluten content being greater than total protein for straight and low-grade flours, nearly the same for patent flours, and less for whole-wheat meal.

"Crude gluten is an expression, in addition to the true gluten content of a flour, of the balance between the loss of nongluten proteids and gain from the retention of nonproteid substances. The relation of the crude gluten content to the total protein content can thus be explained by the varying composition of the different flours in respect to nitrogenous compounds and nonproteids.

"Crude gluten is a very rough expression of the gluten content of a flour or wheat and the determination has but little worth in the valuation of flours.

"The determination of total nitrogen and gliadin nitrogen with expression of the ratio of gliadin to total protein (N × 5.7) seems to be the best simple method at hand for estimating the gluten content and ascertaining the character of the gluten in the valuation of wheats or flours."

Determining the sulphurous acid in meat, C. MENTZEL (*Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 6, pp. 320–324*).—In a number of cases the distillation method showed the presence of small amounts of sulphurous acid (5 to 7.8 mg.) in chopped meat when it could not be identified by means of potassium-iodid-starch paper.

The estimation of undigested protein in feces by means of thiosinamin acid, E. ROSENBERG (*Arch. Verdauungskrank., 11, p. 321*).—Oefele's method of estimating undigested protein is, according to the author's investigations, not reliable.

Concerning the composition of lecithin, M. WINTGEN and O. KELLER (*Arch. Pharm., 244 (1906), No. 1, pp. 3–11*).—Studies of the phosphorus and nitrogen content of lecithins of animal and vegetable origin are reported. The purity of lecithin can not be ascertained by determining the nitrogen and the phosphorus content alone. Whether the determination of the iodin value and the free fatty acid value will serve for the purpose must be determined by further investigation.

General and physiological chemistry of fats, F. ULZER and J. KLIMONT (*Allgemeine und physiologische Chemie der Fette. Berlin: J. Springer, 1906; rev. in Österr. Chem. Ztg., 9 (1906), No. 9, p. 128*).—A monograph on the chemistry of fats from the standpoint of theoretical and physiological chemistry. A feature of the work is the data on the qualitative chemical composition of the fats. Chapters on the hydrolytic cleavage of fat from the standpoint of physical chemistry, by E. Abel, and on the cleavage of fat by enzyms, by S. Fokin, are included.

Concerning the estimation of fat in oil-bearing seeds, F. RUPPEL (*Ztschr. Analyt. Chem., 45 (1906), No. 2, pp. 112–114*).—The modified method proposed consists in extracting the bulk of the fat by treating the finely ground seed for 6 hours with ether, then drying the undissolved residue, grinding with quartz sand, and extracting aliquot portions until all fat is removed.

Contribution to the examination of butter, M. SIEGFELD (*Milchw. Zentbl., 2 (1906), No. 4, pp. 145–164, dgms. 5*).—This is a continuation of investigations previously noted (E. S. R., 17, p. 9).

The data obtained in the examination of the butter from 2 dairies for several years are used as the basis for a discussion of the relative value of determinations of the Reichert-Meissl number, Polenske number, saponification number, iodin number, and the average molecular weight of the fatty acids in the examination of butter. In general, an increase in the Reichert-Meissl number was accompanied by an increase in the saponification number and a decrease in the iodin number, and in the average molecular weight of the nonvolatile fatty acids. The sample having the lowest Reichert-Meissl number, 23.7, had a saponification number of 218.7, an iodin number of 47.4, and an average molecular weight of 269.9. The sample having the highest Reichert-Meissl number, 31.65, had a saponification number of 229.9, an iodin number of 34.6, and an average molecular weight of 257.6.

A simple method of determining fat in milk, KÜTTNER and ULRICH (*Ztschr. Öffentl. Chem., 12 (1906), No. 9, pp. 162–166*).—Numerous tests were made of the Sichler method in comparison with other methods, the results being considered as showing that this method is a decided improvement over the rapid methods previously used.

Gerber's salt method, C. Beger (*Milchw. Zentbl., 2 (1906), No. 3, pp. 120–123*).—The author reports favorably upon the use of this new method of determining fat in milk.

The influence of acetic acid and alcohol in gravimetric determinations of the total solids in milk, A. Segin (*Milchw. Zentbl., 2 (1906), No. 3, pp. 115–119*).—The author uses the covers of porcelain crucibles from which the small central handles have been broken off, measuring into each cover about 2.5 cc. of milk, and rapidly weighing the sample. The milk is then evaporated over a water bath and the residue dried to a constant weight in a water oven at 100° C., which requires about 4 hours. No absorbent material is used.

The time required for drying to a constant weight was increased by the addition of acetic acid and alcohol and higher results were usually secured. The direct drying in small porcelain dishes is recommended as one of the most accurate, convenient, and reliable methods for determining solids in milk.

On the watering of wine and milk, L. Surre (*Ann. Chim. Analyt., 11 (1906), No. 5, pp. 163–165*).—The methods given for the detection of added water depend upon the diphenylamin reaction for nitrates, which is not given by these materials when pure.

Collaborative work on tannin analysis, F. H. Small (*Jour. Soc. Chem. Indus., 25 (1906), No. 7, pp. 296–298*).—This is a brief review of the work of several associations on the methods of estimating tannin. A fairly satisfactory method, the principles of which are given, has resulted, according to the author, from this collaborative work. The various lines of work of the American Leather Chemists' Association now in progress are outlined.

Miscellaneous chemical analyses made in 1901, A. M. Peter and L. O. Beatty (*Kentucky Sta. Rpt. 1901, pp. 263–295*).—Analyses are reported of 49 samples of sorghum juice, 22 of butter, 27 of sugar beets, 17 of soils, 7 of feeding stuffs, 9 of common salt, 4 of crude petroleum, 1 of marl, 2 of phosphate rock, 4 of clay, 4 of ashes, 2 of tobacco stems, 1 of a tobacco by-product, 5 of tobacco extract, 3 of Paris green, 1 of a commercial substance recommended for use in curing tobacco, 5 of Kentucky asphalt rock, 1 of iron ore, and 24 of mineral waters. Determinations were also made of the arsenic in 6 samples of sprayed cabbage.

Miscellaneous chemical analyses made in 1902, A. M. Peter, L. O. Beatty, and S. D. Averitt (*Kentucky Sta. Rpt. 1902, pp. 283–335*).—Analyses are reported of 16 samples of sorghum juice, 31 of sugar beets, 10 of butter, 27 of soils, 1 of old wood ashes, 61 of grasses and forage plants, 6 of soy beans, 1 of mushrooms, 2 of cotton-seed meal, 1 of a calf food, 1 of distillers' corn bran, 1 of dried distillers' grains, 5 of distillery slop, 5 of clay, 2 of niter earth, 1 of dissolved bone, 1 of agricultural lime, 1 of cow manure, and 42 of mineral waters.

Miscellaneous analyses, C. H. Jones and F. M. Hollister (*Vermont Sta. Rpt. 1905, pp. 339, 340*).—Analyses of a number of miscellaneous materials, including nitrate of soda, dried blood, tankage, bone (raw and steamed), acid phosphate, muriate of potash, wood ashes, muck, and mixed fertilizers, are reported.

METEOROLOGY—WATER.

Monthly Weather Review (*Mo. Weather Rev., 34 (1906), Nos. 1, pp. 1–60, figs. 19, charts 8; 2, pp. 61–108, figs. 9, charts 28*).—In addition to the usual reports on forecasts, warnings, weather and crop conditions, meteorological tables and charts for the months of January and February, 1906, recent papers bearing on meteorology, recent additions to the Weather Bureau library, etc., these numbers contain the following articles and notes:

No. 1.—The Cyclonic Storm of October 6–12, 1905, in the North Atlantic Ocean (illus.), by J. Page; Improved Methods for Finding Altitude and Azimuth, Geo-

graphical Position, and the Variation of the Compass—Second Article (illus.); Studies on the Thermodynamics of the Atmosphere—I, Asymmetric Cyclones and Anticyclones in Europe and America (illus.), by F. H. Bigelow; Atmospheric Electricity, by G. C. Simpson; Atmospheric Electricity in High Latitudes, by G. C. Simpson; The Time of Moonrise and Moonset (illus.), by W. F. Rigge; A Possible Extension of the Period of Weather Forecasts, by E. B. Garriott (see p. 1045); Forecasts and Verifications in Western Australia, by W. E. Cooke; The Relation of Forests to Rainfall (illus.), by W. F. Hubbard (see p. 1044); An Important Old Local Weather Record for Philadelphia, Pa.; An Appeal for an Aero-physical Observatory in Japan, by S. T. Tamura; Tornadoes—Hailstones—Thunderclouds, by J. P. Gibson; and Weather Bureau Men as Educators.

No. 2.—The Relation between Storm Movement and Pressure Distribution (illus.), by E. H. Bowie; Climatology of Haiti in the Eighteenth Century (illus.), by C. F. Talman; Mean Annual Rain Map of New South Wales; Studies on the Thermodynamics of the Atmosphere—II, Coordination of the Velocity, Temperature, and Pressure in the Cyclones and Anticyclones of Europe and North America (illus.), by F. H. Bigelow; Vertical Air Currents, by F. W. Proctor; Snow Formed by Mixture of Warm and Cold Air, by R. W. Gray; Prevention of Damage by Frost, by R. P. Skinner (see p. 1044); Early Knowledge of the Tides at Panama, by R. A. Harris; Publication of River Gage Readings; Weather Bureau Men as Educators; Life and Work of James P. Espy; Lectures on Meteorology; Hailstorms in the Bahamas; A Fake Rain Maker; and Outline for the Study of Meteorology in the New York State Normal School.

Meteorological observations (*Idaho Sta. Rpt. 1905, pp. 36–48*).—Daily and monthly summaries are given of observations during 1905 on temperature, pressure, precipitation, cloudiness, and wind movement. The mean temperature of the year was 48.6°, the highest temperature 103°, July 22; the lowest −13°, February 11; the total precipitation (rainfall and melted snow) was 20.37 in., the rainfall being 17.51 in.

Meteorological summaries for the year 1901 (*Kentucky Sta. Rpt. 1901, pp. 296–301*).—Tabular summaries for 1901 are given of observations at the station on pressure, temperature, precipitation, cloudiness, wind movement, and casual phenomena.

Meteorological summaries for the year 1902 (*Kentucky Sta. Rpt. 1902, pp. 336–341*).—Tabular summaries for 1902 are given of observations at the station on pressure, temperature, precipitation, cloudiness, wind movement, and casual phenomena.

Meteorological observations (*Maine Sta. Bul. 124, pp. 229–231*).—Monthly and annual summaries are given of observations at the experiment station on pressure, temperature, precipitation, cloudiness, wind movement, and of rainfall at 24 different places in the State. The mean pressure for the year was 29.84 in., the mean temperature 42.13° (normal for 37 years 42.2°), precipitation 32.01 in. (normal for 37 years 43.98 in.), snowfall 70.5 in. (normal for 37 years 91.6 in), number of clear days 150, cloudy days 121.

"The winter of 1904–5 was one of unusual severity, December being 4½°, January 3°, and February 4° below the average for these months. . . . During this same period the thermometer registered zero or below, as the minimum temperature, on no less than 50 days.

"For three successive years the total precipitation has been very low, the deficit for the past year amounting to about 12 in., or over one-fourth of the whole. The shortage was especially noticeable in March and October, in which months the precipitation was about one-fifth the average. In but one month of the year, November, did the precipitation equal the average amount."

Meteorological observations, J. E. Ostrander and T. A. Barry (*Massachusetts Sta. Met. Buls. 207, 208, pp. 4 each*).—Summaries of observations at Amherst, Mass., on pressure, temperature, humidity, precipitation, wind, sunshine, cloudiness, and casual phenomena during March and April, 1906. The data are briefly discussed in a general note on the weather of each month.

Meteorological observations at the Michigan Agricultural College for the year 1904 (*Michigan Sta. Rpt. 1905, pp. 99–123*).—Tabulated daily and monthly summaries of observations during 1904 on temperature, pressure, precipitation, humidity, cloudiness, wind movement, etc.

Swedish meteorological observations, 1904, H. E. Hamburg (*Met. Iakttag. Sverige* [*Observ. Mét. Suéd.*], *K. Svenska Vetensk. Akad., 46 (1904), pp. X+157*).—This report is divided into 3 parts, (1) daily observations at 18 stations of the second order, (2) monthly and annual summaries of all the meteorological elements furnished by 39 stations of the second order, and (3) 5-day means of temperature at the 39 stations included in part 2.

Meteorological observations for the year 1904 at the Ploti Agricultural Experiment Station, M. Svolinsky (*Ghodichnuĭ Otchet Ploty. Selsk. Khoz. Opuitn. Stantzīi, 10 (1904), pp. 1–25*).—As in previous years (E. S. R., 16, p. 544), this report summarizes observations on precipitation (including snowfall), evaporation, humidity of the air, temperature of the air and of the soil at different depths, insolation and solar radiation, atmospheric pressure, and direction of wind. The total precipitation during the year was 299.4 mm., the smallest for the ten years during which observations have been made at the station. The distribution of the rainfall, however, was favorable for the growth of crops. The mean annual temperature of the air was below normal. The maximum temperature was 35.1° C., July 18; the minimum, —23.2°, January 11 and 13. The maximum pressure during the year was 764.6 mm., the minimum 728 mm. The prevailing direction of wind was northwest.

Observations at the meteorological observatory of the University of Innsbruck in 1902, W. Trabert (*Ber. Naturw. Med. Ver. Innsbruck, 29 (1903–4, 1904–5), pp. 277–337*).—Detailed tabular records of daily observations on atmospheric pressure, temperature, humidity, cloudiness, wind, and precipitation, and hourly observations with self-recording apparatus on pressure, temperature, humidity, rainfall, and sunshine are given for each month of the year.

International Meteorological Conference at Innsbruck (*Nature* [*London*], *72 (1905), Nos. 1873, pp. 510–512; 1875, pp. 562, 563; 73 (1906), No. 1892, pp. 331, 332*).—A summary account of proceedings of this conference held at Innsbruck September 9–15, 1905, under the presidency of J. M. Pernter.

In his opening address the president discussed particularly the importance and progress of exploration of the upper air and the problem of weather periods and their connection with and dependence on the activity of the sun. Among the subjects receiving particular attention were investigations of excessive rainfall, solar radiation, long series homogeneous observations, meteorological observations during the last century, island meteorological stations, and use of wireless telegraphy to announce the approach of storms.

Japanese meteorological service in Korea and China, S. T. Tamura (*Science, n. ser., 23 (1906), No. 584, pp. 396, 397*).—The organization of a series of stations under the supervision of the Chemulpo Meteorological Observatory and their equipment are briefly described.

Climatic notes on the Sahara, E. F. Gautier (*Ann. Géogr., 14 (1905), No. 78, pp. 459–461; Bul. Amer. Geogr. Soc., 38 (1906), No. 1, pp. 32–34; abs. in Science, n. ser., 23 (1906), No. 588, p. 555*).—The more important climatic facts brought out in this report are that strictly desert conditions are not as extensive in the Sahara as is generally believed; and that there have been three epochs in the climatic history

of the region, the first marked by conditions which supported a dense population (of the neolithic period), the second by desert conditions, and the third, or present period, in which the land is gradually assuming a steppe-like character.

The gradual desiccation of the region advanced from the Soudan, but to-day the rainbelt is again extending more and more toward the north. On the steppes, where the Soudan merges into the Sahara, the annual rainfall is 6 to 12 inches and supports considerable vegetable and animal life.

Texas rainfall during 1905 (*Texas Farm and Ranch, 25 (1906), No. 10, p. 3, fig. 1*).—A map with brief notes furnished by E. E. Spencer, director of the Texas section of the Weather Bureau, is given. The average annual precipitation for the State as determined from reports of 87 stations was 44.49 in., or 12.55 in. above the normal. The greatest annual precipitation was 86.32 in. at Jefferson, the least 17.8 in. at El Paso. The heaviest rainfall occurred over the eastern, northeastern, central, and coast regions of the State.

Rainfall in the agricultural districts, G. G. Bond (*Queensland Agr. Jour., 16 (1906), No. 5, p. 380*).—A table is given which shows the total rainfall for each month from December, 1904, to December, 1905, inclusive, in 41 agricultural districts of Queensland.

The relation of forests to rainfall, W. F. Hubbard (*Mo. Weather Rev., 34 (1906), No. 1, pp. 24–26, figs. 2*).—The distribution of forests as dependent upon rainfall is illustrated by conditions in California, and it is shown that "topography and winds are the controlling factors in the distribution of forests. They make most of the Pacific coast a region of winter rains and summer droughts, and, away from the coast, limit the forests to the higher altitudes. . . . As rainfall determines the presence or absence of forests, so the configuration of the land and its relation to water bodies and constant winds determine the rainfall."

Forests and rainfall in Silesia, J. Schubert (*Ztschr. Forst u. Jagdw., 37 (1905), No. 6, pp. 375–380, figs. 3; abs. in Met. Ztschr., 22 (1905), No. 12, pp. 566–570, figs. 3, and Science, n. ser., 23 (1906), No. 589, p. 593*).—This subject is discussed on the basis of the rainfall map published by Hellmann in 1899, the conclusion reached being that forests seem to produce an increase in precipitation. This is ascribed to the fact that forests retard wind movement and promote rise and cooling of the air. If one-half of the observed difference is set down as being due to the increased protection of the gauges set up in or near the forests, the actual effect of the trees themselves would roughly correspond to an increase in altitude of 40 meters.

Prevention of damage by frost, R. P. Skinner (*Mo. Weather Rev., 34 (1906), No. 2, pp. 79, 80*).—Tests of various smudges and the use of potash salts as fertilizers are reported, which, while not conclusive, indicate that more or less protection may be afforded in some cases by such means.

Cloud studies, A. W. Clayden (*London: John Murray, 1905, pp. XIII + 184, pls. 61; rev. in Nature [London], 73 (1906), No. 1896, pp. 416, 417, figs. 2*).—In his review of this book Prof. H. H. Hildebrandsson states that it will be a standard work for all students of clouds. The author accepts the types of the International Cloud Atlas and arranges his various forms as subforms of these types with the exception of the nimbus cloud, which he classifies as a subform of the stratus type.

On cloud formation in the Alpine valleys.—Contributions to the mechanism of cloud formation, H. von Ficker (*Ber. Naturw. Med. Ver. Innsbruck, 29 (1903–4, 1904–5), pp. 193–275*).—A series of observations at various elevations to study especially the formation of stratus clouds in inland valleys is reported.

Apparatus for observing and recording storms (*Sci. XX. Siècle, 1905, Aug. 15, Sup.; abs. in Rev. Sci. [Paris], 5. ser., 5 (1906), No. 9, pp. 278, 279*).—An apparatus devised by A. Turpain, of the meteorological observatory of Puy-de-Dôme for photographically and automatically recording the electrical condition of the atmosphere during storms is described.

A possible extension of the period of weather forecasts, E. B. GARRIOTT (*Mo. Weather Rev., 34 (1906), No. 1, pp. 22, 23*).—A study of counterbalancing tendencies with regard to weather abnormalities in different parts of the globe leads to the conclusion that with completion of daily telegraphic communication with the dominating "centers of atmospheric action" over Siberia, the Alaskan coast, the Azores, and Iceland, "daily available forecasts can undoubtedly be made of the general character of the weather for at least one week in advance. Such general forecasts could specify the character, whether warm or cold, wet or dry, of the weather of the near future, and could indicate the duration and termination, days in advance, of periods of abnormal weather."

Public water supply of Ohio (*Ann. Rpt. Bd. Health Ohio, 19 (1904), pp. 61–343*).—Reports are given on plans for water supplies or sewerage proposed during 1904 for a large number of places in Ohio.

The results of laboratory examination of waters, sewage, and sewage effluents, and studies of methods of purification are also reported in detail.

It is stated that "with but few exceptions the surface waters of the State are unsuited for a public supply. In many regions the ground water is inadequate for a city of much size. The purification of surface waters must receive more and more attention. A filtration plant must be properly constructed and efficiently operated to afford a safe water supply."

It is suggested that "it would seem not improper for the State Board of Health to collect the evidence to show that the water supply of any city is dangerous to life and health. The attorney-general might present this evidence to a court of competent jurisdiction—to the supreme court, if possible. If satisfied that conditions were such that public interests warranted and demanded it, this court should have authority to compel the city to make necessary improvements within a reasonable time."

Seventy-one cities and 177 villages, representing 55 per cent of the population of Ohio, had a public water supply in 1904.

The sources of water supply in Wisconsin, W. G. KIRCHOFFER (*Bul. Univ. Wis., No. 106, pp. 163–267; abs. in Engin. News, 55 (1906), No. 13, pp. 355, 356*).—It is stated that of the 270 cities and villages in Wisconsin 120 are provided with a public water supply. Fifty of the latter use artesian water, 30 ground water, 14 lake water, 12 river water, and of the remainder the source of supply is not definitely known. Of the artesian well supplies, 27 are from Potsdam sandstone, 10 from St. Peters sandstone, and the remainder from both.

As regards the amount of water used from the various sources, lake waters rank first, artesian waters second, ground waters third, and river waters fourth. As to sufficiency or quantity, lake waters rank first, river waters second, artesian waters third, and ground waters fourth, and as to purity, artesian waters rank first, lake waters second, ground waters third, and river waters fourth. The most serious troubles with artesian waters were hardness and presence of iron.

The biology of water bacteria, E. KOHN (*Centbl. Bakt. [etc.], 2. Abt., 15 (1906), Nos. 22–23, pp. 690–708, figs. 3; 25, pp. 777–786*).—This article reports studies on the general course of multiplication of micro-organisms and changes in the composition of the bacterial flora when water is allowed to stand and the food requirements of a series of saprophytic fresh-water micro-organisms.

The bacterial flora was found to change quantitatively and in composition when large samples of sweet water were allowed to stand for a long time. The increase in germination was greatest in vessels of the kinds of glasses which were the most soluble in water. The phosphorus thus dissolved from the glass was sufficient for the requirements of the organisms. The organisms were found to vary widely with regard to their behavior toward the nutrient solutions, particularly the concentration of grape

sugar and ammonium sulphate solutions supplied. Three per cent grape-sugar solution was found to be too strong for *Urobacillus pasteuri*.

Experiments with copper-iron sulphate for water purification at Marietta, Ohio (*Engin. Rec., 53 (1906), No. 12, pp. 392–394, figs. 4*).—The successful use of a mixture of copper and iron sulphates precipitated with caustic lime and held on the filter for precipitation of impurities and reduction of the number of bacteria in water is reported.

SOILS—FERTILIZERS.

Soils, T. Dietrich and F. Honcamp (*Jahresber. Agr. Chem., 3. ser., 7 (1904), pp. 25–99*).—A review is given of the literature relating to this subject published during 1904, classified as follows: Rocks, stones, and their weathering products; cultivated soils, including analyses of soils, physics of soils and absorption, and the lower organisms of soils; and moors and moor culture.

Mechanical analysis of soils, J. A. Murray (*Chem. News, 93 (1906), No. 2409, pp. 40–42; abs. in Analyst, 31 (1906), No. 361, pp. 129, 130*).—This article describes "a long tube sedimentation process."

The apparatus employed consisted of an Erlenmeyer flask (of about 200 cc. capacity) of which the neck, after removal of the flange, was exactly the same diameter as a long glass tube which was attached to it by means of a piece of india-rubber tubing fitted outside of the tube and of the neck of the flask. The tube actually used was 147 cm. long by 2.3 cm. internal diameter. "A wide shallow glass basin about 20 cm. diameter and a few small porcelain evaporating dishes about 7.5 cm. diameter are also necessary. . . .

"The experiment was carried out as follows: Five gm. of the air-dried fine soil (i. e., that which had passed through 100-mesh sieve), thoroughly disintegrated in dilute ammonia solution, was put into the flask, which was then vigorously shaken, filled nearly full of water, and attached to the tube. Water was then poured gently down the side of the tube (so as not to disturb the sediment in the flask) till it also was full, when the open end was closed with a cork, and the whole inverted over the large basin of water. The cork closing the end was immediately withdrawn, and one of the small porcelain evaporating dishes, previously dried and weighed, placed beneath the open end of the tube.

"The sediment began to descend whenever the tube was inverted, and the first particles were deposited in the dish in about fifteen seconds. After a short interval this dish, containing the first portion, was removed and replaced by another, and this again by a third, and so on. These dishes containing the several fractions of the sediment thus removed from the large basin were of course full of water, of which, however, a considerable part was separated by simple decantation, after standing for a few minutes, and the remainder driven off on the water bath. The dried residue was then weighed, and examined under the microscope for determination of the size of the particles."

Results of tests of the method on a sample of stiff clay soil and of Rothamsted soil are reported.

It was found advisable in case of the heavier soil to make a preliminary rough separation of the finer and coarser material by shaking with weak ammonia, allowing to stand 15 minutes, and pouring off the solution containing the fine material in suspension. The coarser material was introduced into the apparatus described and separated into 3 fractions, viz, those separating in 5, 15, and 40 minutes after the beginning of the test. Preliminary separation was not necessary in case of the lighter Rothamsted soil.

A chemical study of some Oregon beaver-dam soils, C. E. Bradley (*Jour. Amer. Chem. Soc., 28 (1906), No. 1, pp. 64, 65*).—Analyses of 5 samples of beaver-dam

soils of the Willamette Valley, one of which is virgin and the others have been used for a number of years in onion growing, are reported.

These soils when virgin are composed largely of organic matter of a peaty nature. They are porous, light, and loose, with no tendency to bake or form lumps. The analyses show that their nitrogen content is large. Potash is present in liberal quantities, but is of low availability. Phosphoric acid is not deficient and is largely in available form. The soils contain sufficient lime to keep them sweet, and lime is always in excess of magnesia.

The nitrogen content of the virgin soil was 1.56 per cent and varied from 0.78 to 2.06 per cent in 3 of the cultivated soils. The total potash content was 0.14 per cent in the virgin soil and varied from 0.1 to 0.28 per cent in the other soils. The phosphoric-acid content was 0.26 per cent in the virgin soil, varying from 0.21 to 2.3 per cent in the cultivated soils. The availability of the potash and phosphoric acid was determined by digestion in 0.5 per cent hydrochloric acid.

Report on the soils of Dorset, with suggestions on manuring, cultivation, etc., J. Percival (*Univ. Col. Reading, Agr. Dept., Ann. Rpt. Soils Dorset, 7 (1905), pp. 50, map 1*).—This report summarizes in a simple manner the more practical results of the analyses of 100 samples of soil from various parts of Dorsetshire which have been previously reported (E. S. R., 15, p. 857), the information being adapted especially to those engaged in farming in Dorset.

"The first part of the report contains general information as to manures. In this part will be found a description of some of the chief kinds of manures and suggestions as to the use of manures for various crops. Some notes on grass mixtures are also given. The second part of the report contains a description of the various kinds of soils in the county according to their geological formations; and suggestions are given on points connected with the manuring and cultivation of each class of soil, largely based upon the analyses of typical soils, of which a list (with the results) is given for each district."

A geological map is given which makes it possible to locate the different classes of soils discussed. It is shown that a large proportion of the area consists mainly of chalk formation, while another large area is occupied by a series of sands of low fertility. The chief deficiency of the chalk soils seems to be potash.

On loess soils and loess marls, Halenke, Kling, and Engels (*Vrtljschr. Bayer. Landw. Rat., 10 (1905), No. 3, pp. 447–455*).—This article describes the various types of loess occurring in the Rhenish Palatinate and discusses their origin and transformations, especially their changes in lime content. Examinations of a large number of samples show a variation of 0.08 to 6.05 per cent of lime in the surface soil and 0.19 to 47 per cent in the subsoil, ranging from pure sandy loess to loess marl. The chemical and physical make-up of the latter is considered in detail.

The fertilizer requirements of Hessian soils, E. Haselhoff (*Das Düngungsbedürfnis der hessischen Böden, pp. 39; Fühling's Landw. Ztg., 55 (1906), No. 3, pp. 73–81*).—The composition and fertilizer requirements, as determined by pot experiments, of Hessian soils of different geological origins are discussed.

The soils tested were of basalt, bunter-sandstein, shell lime, graywacke, and clay slate types. The composition of the different soils and of the rocks from which they were originally derived is given. All of the soils responded to applications of nitrogen. Their behavior toward potash was variable, depending upon their origin and content of available potash as shown by analysis. The basalt, shell lime, and clay slate soils were benefited by applications of phosphoric acid, the graywacke soils did not respond to such applications, and bunter-sandstein soils varied in their behavior toward phosphoric acid according to the amounts of available phosphoric acid present as shown by analysis. Only the basalt soils showed a need of lime. It was concluded that pot experiments are a reliable means of determining the fertilizer requirements of soils.

The effect of plant growth and of manures upon the retention of bases by the soil, A. D. Hall and N. H. J. Miller (*Proc. Roy. Soc.* [*London*], *Ser. B, 77 (1905), No. B514, pp. 1–32, figs. 2; abs. in Jour. Chem. Soc.* [*London*], *90 (1906), No. 520, II, pp. 119, 120*).—The investigations reported in this article deal "with the changes in the amount of calcium carbonate, the chief substance in the soil acting as a base, which are brought about by natural agencies, by manuring, and particularly by the growth of plants."

It is stated that the Rothamsted soils generally contain about 3 per cent of calcium carbonate, due mainly to former applications of chalk. "Determinations made in numerous samples from different plats of Broadbalk, Agdell, and Hoos fields, taken at different dates from 1856 to the present time, show that the soils of the unmanured plats lose in drainage on the average about 1,000 lbs. of calcium carbonate per acre per annum. This agrees closely with results derived from analyses of field drainage by Creydt, von Seelhorst, and Wilms [E. S. R., 13, p. 723; 16, p. 856].

"The loss of calcium carbonate is increased when ammonium salts are employed by an amount equivalent to the acid of the manure. Sodium nitrate and farmyard manure diminish the loss.

"Analyses of wheat plants grown in water culture and of the solutions themselves showed that the plants take up an excess of acid from the salts supplied, leaving behind a corresponding excess of base. This explains how it is that, despite losses by nitrification, soils which contain only minute amounts of calcium carbonate (examples of such soils are given) are able to maintain a neutral condition. The experiments also furnished evidence that the roots of the plants did not excrete any organic acid or other organic matter.

"Finally it is shown that calcium oxalate and other organic salts are converted into carbonate by soil organisms."

Investigations on changes in the nitrogen of soils, F. Löhnis (*Mitt. Landw. Inst. Leipzig, 1905, No. 7, pp. 1–105; Centbl. Bakt.* [*etc.*], *2. Abt., 15 (1905), Nos. 12, pp. 361–365; 13–14, pp. 430–435; abs. in Jour. Chem. Soc.* [*London*], *88 (1905), No. 518, II, p 854; 90 (1906), No. 519, II, p. 46*).—The investigations here reported were made on soil of a plat on the Oberholz experimental field of the agricultural institute of the University of Leipzig during 1903 and 1904.

Oats were grown on the plat in 1903, and after these were harvested half of the area was given shallow cultivation while the other was left in stubble. In 1904 the field was planted in potatoes, which received applications of the various fertilizers (bone meal, lime nitrogen, urea, ammonium sulphate, sodium nitrate, etc.), the transformations of which it was the purpose of the experiments to study, namely, the formation of ammonia from bone meal, lime nitrogen, and urea; the formation of nitrate from ammonium sulphate; the liberation of nitrogen from nitrate, and the fixation of nitrogen by bacteria. The influence of the time of year (temperature), weather, and of various methods of culture on the yields and utilization of the nitrogen of the different fertilizers was also studied, and the different kinds of bacteria which took part in the transformation of the nitrogen were isolated and determined.

Decomposition was least affected by the season of the year in case of bone meal and most in case of urea and calcium cyanamid. The nitrogen of calcium cyanamid was quickly converted into ammonia during April and May, and its effect on the crop was similar to that of ammonium salts. It was found that *Bacillus mycoides* converted 39 per cent and *Bacterium vulgare* 28 per cent of the total nitrogen of bone into ammonia in 3 weeks. Allowing the soil to remain in stubble had a distinct effect on denitrification and nitrogen assimilation, but not on the other changes.

The chief effect of bringing the lower layers of the soil to the surface was to diminish nitrification, the least effect being observed in the case of decomposition of bone meal and urea, while there was no effect as regards nitrogen assimilation and decomposition of calcium cyanamid. Dry weather in July was especially injurious as

regards nitrification, nitrogen assimilation, and the decomposition of calcium cyanamid, but was practically without effect on denitrification and decomposition of bone meal and urea. It is concluded that water to the extent of from 60 to 80 per cent of the water-holding capacity of the soil is required for the uninterrupted progress of the various changes in the nitrogen of the soil.

In these investigations soil extracts were used as a culture medium with good results. These extracts were prepared by boiling 1 kg. of soil for 2 hours with 2 liters of tap water. The solution, evaporated to a volume of about 800 cc., was cleared up with talc and filtered, and the filtrate was evaporated until it contained about 0.4 per cent of inorganic constituents. In this way 1 kg. of soil gave as a rule about 600 cc. of neutral extract containing 0.4 per cent of inorganic and 0.6 per cent of organic constituents. The nitrogen content was about 0.02 per cent and the solution was almost entirely free of phosphoric acid. Except in the case of the experiments with bone meal, therefore, about 0.5 per cent of dipotassium phosphate was added. In the experiments reported this extract was inoculated with soil, using the latter at the rate of 10 gm. of soil to 100 cc. of solution.

Report of the chemical laboratory of the Ploti Agricultural Experiment Station, B. M. Welbel (*Ghodichnuĭ Otchet Ploty. Selsk. Khoz. Opuitn. Stantzĭi, 10 (1904), pp. 75–120; abs. in Centbl. Agr. Chem., 35 (1906), No. 2, pp. 73–76*).—A continuation and extension of previous work (E. S. R., 16, p. 552) on atmospheric precipitation, lysimeter observations, and experiments in vegetation boxes is reported.

The report deals with studies of the adaptability of lysimeters to the investigation of questions relating to the balance of water and nitrogen in the soil as influenced by variations in precipitation, methods of culture, manuring, etc. Three groups of lysimeters installed at the station and the kind of investigations for which they are used are described. It has been found that the method of construction and of filling the lysimeters has a most important bearing upon the results obtained.

Special attention has been given in the experiments with the lysimeters to a comparison of the influence of black fallow and green fallow on the water and nitrogen content of the soil. Black fallow as practiced in these experiments consisted of cultivating the soil and allowing it to lie idle until the following fall. Green fallow consisted in allowing the land to lie without cultivation from one summer to the next. More water accumulated in the lower layers of the black fallow soil than in those of the green fallow, the reverse being true for the upper layers of the soil, but in the latter case the differences were very small.

The drainage was greater in case of the black fallow than in case of the green. There was a greater accumulation of nitrates and greater loss in drainage in the black fallow than in the green. The losses in the drainage were, however, more than made good by nitrogen compounds brought down from the air, aggregating 4.5 kg. of nitrogen per hectare annually. During three years of observation the application of barnyard manure increased the production of nitrates (nitric nitrogen) in the soil 120 kg. per hectare. During the same period soil bearing alfalfa produced 50.22 kg. of nitric nitrogen more per hectare than soil not bearing alfalfa.

Some field notes on soil inoculation, H. N. Starnes (*Georgia Sta. Bul. 71, pp. 91–105, pls. 12*).—The present status of knowledge regarding soil inoculation for legumes is briefly reviewed and experiments with commercial cultures of nitrogen-fixing bacteria on cowpeas grown in an isolated field of typical red-clay land in a low state of fertility are reported.

The experiments were made on fertilized and unfertilized areas of this soil. The results do not indicate any particular advantage from inoculation. "In yield of vines an increase appears per acre of 175 lbs., or about 3 per cent, in favor of the untreated over the inoculated plats, while in the yield of peas the difference is reversed, there being apparent an increase of 35 lbs. per acre, or something less than 5 per cent, in favor of the inoculated plats."

The conclusion is reached "(1) that few soils throughout middle Georgia are likely to be found not already thoroughly colonized or inoculated with the special form of *Pseudomonas radicicola* which uses the cowpea as its host. (2) Consequently, whether the commercially distributed 'cotton-dried' nitro-culture for the cowpea does or does not contain living colonies of this bacterium, it is valueless here."

Observations on a series of introduced leguminous plants indicate that the cowpea organism, which is everywhere abundant in the soils of the station farm, is capable of inoculating leguminous plants of widely differing species. Among the unusual plants so tested and found to develop root tubercles when grown for the first time on the station farm were green gram (*Phaseolus viridissimus*), Newman bean (*P. mungo*), *P. radiatus*, *P. aconitifolius*, and *P. angustissimus*.

"Now, the bacteria forming these tubercles were derived either from the soil itself (that is, from the universally disseminated cowpea bacteria) or were conveyed by the planted seed. The latter hypothesis, though possible, is unlikely, especially since desiccation has been proven so extremely fatal to *P. radicicola*. Had the seed been sterilized before planting it would have, of course, determined the matter; but the plat was merely a variety test of certain Phaseoli, with no reference to its bearing upon soil inoculation. In either case it seems to indicate that our soil is not dependent upon artificial inoculation."

Soil inoculation for legumes from artificial cultures by the help of bacteria, C. D. Woods and J. M. Bartlett (*Maine Sta. Bul. 126, pp. 28–30*).—Negative results in inoculation experiments with peas, clover, and alfalfa on a number of farms in different parts of Maine during the season of 1905 are reported. The cultures used for inoculation were obtained from this Department and from a commercial concern. The farmers of the State are cautioned not to depend upon such cultures, but in case of attempts to raise leguminous crops not commonly grown in the region to inoculate their land with soil from fields on which the crops have been grown.

An experiment with Moore's cultures of nitrogen-fixing bacteria, V. Peglion (*Staz. Sper. Agr. Ital., 38 (1905), No. 9, pp. 769–784, pls. 4*).—The results of experiments with medic, lupines, sulla, and white clover on virgin and cultivated soils indicate as a rule that Moore's cultures were very active in producing root tubercles and in increasing growth in soils which had not already been inoculated by natural means; but the writer points out that such conditions are exceptional in localities where legumes of various kinds have been grown for centuries, and hence the cultures have only a limited usefulness in practice and should not be expected to take the place to any extent of good cultivation and the application of mineral fertilizers to promote the growth of legumes.

Nitrification of the organic matter applied to the soil in form of sewage, G. Masoni (*Atti R. Accad. Econ. Agr. Georg. Firenze, 5. ser., 2 (1905), No. 3, pp. 196–208*).—This is an account of a continuation of previous experiments by the author and relates particularly to the relation of moisture to denitrification.

The experiments here briefly reported lead to the conclusion that liquid sewage from cesspools is not only capable of rapidly nitrifying when applied to the soil, but also aids nitrification in the soil itself. Loss of nitrogen from the soil during hot dry summer weather may be checked by applications of sewage.

Recent experiments in the nitrogen-enrichment of soils, F. T. Shutt and A. T. Charron (*Separate from Proc. and Trans. Roy. Soc. Canada, 2. ser., 11 (1905), Sec. III, pp. 53–64*).—This paper (1) presents the results of certain recent researches that demonstrate the extent and rapidity of the depletion of soil nitrogen under what is evidently an irrational method of farming, and (2) brings forward data to show the value of the legumes, especially clover, as a means of maintaining and increasing fertility through the addition of nitrogen and humus. The discussion is based upon field and laboratory studies made by the authors at the Canadian Experimental Farms.

A new nitrogenous manure, J. HENDRICK (*Trans. Highland and Agr. Soc. Scot., 5. ser., 18 (1906), pp. 75–77*).—Field experiments on oats and barley with lime nitrogen as compared with nitrate of soda and sulphate of ammonia are briefly reported. The results show that the lime nitrogen was but slightly inferior to nitrate of soda or sulphate of ammonia. "In no case did any injury appear to be caused to the germination of oats or barley by using the cyanamid at the rate of 1 cwt. per acre along with the seed."

The conversion of atmospheric nitrogen into nitric acid, L. GRANDEAU (*Jour. Agr. Prat., n. ser., 11 (1906), No. 8, pp. 233–235*).—This article briefly reviews investigations on this subject and describes the various methods which have been proposed for fixing the nitrogen of the air, particularly that of Birkeland and Eyde.

Chemistry and the world's food, R. K. DUNCAN (*Harper's Mo. Mag., 112 (1906), No. 671, pp. 720–731*).—A popular review of progress in investigations relating to the utilization of the nitrogen of the air for industrial purposes, especially as a fertilizer.

Nitrogen requirements of crops, L. GRANDEAU (*Jour. Agr. Prat., n. ser., 11 (1906), No. 7, pp. 201–203*).—The demands of crops on the nitrogen of the air and the soil are briefly discussed.

It is estimated that the crops produced on the 24,000,000 hectares (9,716,575 acres) of land under cultivation in France remove about 273,000 metric tons more of nitrogen, 149,000 tons more of phosphoric acid, and 377,000 tons more of potash than is returned to the soil by farm manures. The most economical means of making up this deficit are discussed.

Fertilizers, E. HASELHOFF (*Jahresber. Agr. Chem., 3. ser., 7 (1904), pp. 100–229*).—A review is given of the literature relating to this subject published during 1904, classified as follows: Analyses of fertilizers and preservation of manure, results and methods of fertilizer control, and fertilizer experiments.

Commercial fertilizers, G. ROBERTS (*California Sta. Bul. 171, pp. 29, figs. 3*).—The results of fertilizer inspection during the year ended June 30, 1905, are reported, including analyses of 151 samples of fertilizers and notes on valuation, mechanical condition of fertilizers, etc., and the text of the fertilizer law.

Commercial fertilizers, G. ROBERTS (*California Sta. Bul. 173, pp. 26*).—This bulletin gives the results of fertilizer inspection during the six months ended December 31, 1905, including analyses of 138 samples of fertilizers and a list of brands of fertilizers and fertilizing materials offered for sale by the registered manufacturers and dealers in the State.

Fertilizer inspection, C. D. WOODS and J. M. BARTLETT (*Maine Sta. Bul. 127, pp. 47–64*).—This bulletin contains the analyses of manufacturers' samples of brands of fertilizers licensed before February, 1906, with explanations regarding constituents of fertilizers and valuation.

Commercial fertilizers, J. L. HILLS and C. H. JONES (*Vermont Sta. Bul. 121, pp. 81–104*).—This is the first bulletin issued in connection with the fertilizer inspection for 1906 and gives results of analyses of 56 brands. A table is also included showing the composition of 126 brands on sale in the State during the past 5 years. The character and contents of the more important previous bulletins of the station on fertilizers are explained and notes are given on valuation.

Commercial fertilizers, J. H. STEWART and B. H. HITE (*West Virginia Sta. Bul. 97, pp. CIII–CVII+108–170*).—This is the complete report of the work of fertilizer inspection in West Virginia during 1905, including analyses of 238 samples.

Commercial fertilizers, M. S. MCDOWELL (*Ann. Rpt. Penn. Dept. Agr., 10 (1904), pp. 135–155*).—This is a general discussion of the sources, nature, and uses of the various commercial supplies of nitrogen, phosphoric acid, and potash.

Artificial fertilizers, their functions and use, F. E. LEE (*Journ. Dept. Agr. Victoria, 3 (1905), No. 10, pp. 713–725, fig. 1*).—This article summarizes information

regarding the source, nature, and use of fertilizers, giving also suggestions regarding the mixing of fertilizers and a discussion of methods of valuation.

The fertilizer industry (*Tradesman, 54 (1906), No. 9, pp. 98, 99*).—Data are given for 10 southern States, showing 162 fertilizer establishments with an invested capital of $29,966,685 and a value of product of $18,921,591.

Mineral resources of the United States, calendar year 1904, D. T. Day (*U. S. Geol. Survey, 1905, pp. 1264, pls. 2*).—The principal information of agricultural interest in this report has already been noted from another source (E. S. R., 17, p. 451).

Fertilizer trials at the Royal Agricultural Academy of Sweden, 1903-4, H. G. Söderbaum (*K. Landtbr. Akad. Handl. och Tidskr., 44 (1905), No. 4-5, pp. 289-311, fig. 1*).—*On the after effects of different kinds of phosphatic fertilizers.*—This is a report of an investigation conducted since 1901, in which the effects of the following phosphatic materials have been studied: Superphosphate, dicalcium phosphate, tricalcium phosphate, precipitated phosphate, and bone meal. Different varieties of oats were grown in vegetation pots each year, and after the first year applications of sodium nitrate and potassium sulphate, with or without addition of calcium carbonate, were made each year.

The highest aggregate yields of oats for the four-year series were obtained from the applications of superphosphate and of dicalcium phosphate, and the action of these fertilizers appeared to be independent of whether or not lime had been added. The effect of both tricalcium phosphate and bone meal was reduced by nearly one-half during the four years by the addition of lime, and the superiority of the former over the latter in the case of the limed pots, and of bone meal over the tricalcium phosphate in the case of the pots receiving no lime, gradually disappeared, so that the total results for the entire series were practically the same. The action of bone meal (with no lime) was found to be decidedly inferior to superphosphate even after the fourth year.

The fertilizer value of Algerian phosphate and apatite compared with that of other phosphatic materials.—The trials were made in 10-in. glass cylinders, with oats grown in a sandy soil, and with peas grown in a marsh soil. In the former trials Algerian phosphate produced an increase of only 3.3 to 5.3 per cent over the cylinders receiving no phosphoric acid, the increase obtained in the case of superphosphate being placed at 100, and the increase in the case of the fine-ground apatite amounted to 0.4 to 1 per cent, according to the quantity of phosphoric acid added (50 to 150 kg. per hectare). In the latter trials with peas on marsh soil the effect of the sifted Algerian phosphate was about 57 per cent of that of superphosphate for peas alone, and 63.7 per cent for the entire crop (peas and vines). The corresponding figures obtained for apatite were 3.9 per cent and —1.4 per cent.

Culture trials to determine in how far the effect of phosphatic fertilizers depends on the character of the simultaneous nitrogenous fertilization.—It has been found in earlier investigations that the effect of superphosphate or dicalcium phosphate was not influenced by the kinds of nitrogenous fertilizer applied, but that the tricalcium phosphate and bone meal produced appreciably larger crops when mixed nitrogenous fertilizers were applied than when sodium nitrate only was added with the phosphates.

This subject was studied further by the author during the years 1902 to 1904. In pot experiments with Ligowo oats, in which different phosphatic materials were added with either nitrate of soda or nitrate of ammonia, the results obtained with superphosphate or Thomas phosphate were higher in the case of applications of nitrate of soda than when corresponding amounts of ammonium nitrate were applied, while the opposite held true with Algerian phosphate and with bone meal. The effect of applications of different nitrogenous fertilizers in connection with bone meal

was next studied, also for Ligowo oats, with the result that a marked increase in yields was obtained with ammonium sulphate.

The next highest results were secured in the case of fertilization with ammonium sulphate and sodium nitrate, while sodium nitrate alone with bone meal gave the lowest results, this effect being equally marked both in the yield of total crop and of grain. Liquid manure or albumen with sodium nitrate gave somewhat lower results than sodium nitrate and ammonium sulphate. The effect of the phosphatic fertilizers applied is, therefore, shown to depend to a large extent on the character of the nitrogenous fertilizers applied or present in the soil.

Culture trials with nitrogenous and phosphatic fertilization in increasing amounts.—These trials were planned to study the methods of pot experimentation. They were conducted in glass cylinders, 29 cm. deep by 24 cm. in diameter, filled with 28½ kg. of a sandy soil, low in nitrogen (0.011 per cent) and phosphoric acid (0.04 per cent phosphoric acid soluble in hot hydrochloric acid, sp. gr. 1.15), the crop grown being oats.

In the first series, in addition to a basic fertilization of fine-ground marble, superphosphate, and potassium sulphate, with a slight addition of magnesium sulphate and salt, sodium nitrate was added to different cylinders in amounts ranging from 1.5 to 6 gm. per cylinder (50 to 200 kg. per hectare). Increasing nitrogenous fertilizations in all cases produced an increase in the crops harvested, the increase being largest with the smallest amounts of nitrate applied and smallest with the heaviest applications, so that the increase obtained beyond applications of 150 kg. per hectare (134 lbs. per acre) may be considered within the limits of experimental error.

Both the weights of kernels and of straw increased with increasing applications of nitrate. The ratio of straw to kernels was narrowest in the case of the largest amounts applied, up to 125 kg. per hectare, when a small widening of the ratio began to appear. It was found, in general, that a fertilization of 150 kg. per hectare (= 0.026 gm. per kilogram of soil) produced an optimum development of the crop, and that the crop produced on a fertilization of 50 kg. of nitrate by its appearance gave decided evidence of a lack of proper nitrogenous fertilization.

In the second series the trials were conducted under similar conditions as in the case of the preceding series; 0.71 to 5.71 gm. of superphosphate (corresponding to 25 to 200 kg. per hectare) were added to sets of 3 cylinders each. The increase in the oat crop harvested from the different cylinders was less regular in this than in the preceding series. The highest increase was obtained between 25 and 50 kg.; between 75 and 125 kg. only a small increase in yield was secured, while at 150 kg. a marked increase again occurred, the maximum crop being obtained at 175 kg. Between 175 and 200 kg. a decrease in yield occurred. The optimum results evidently lay between 75 and 150 kg., and may be placed at 0.017 gm. per kilogram of soil for the soil experimented with and under the conditions of these trials.—F. W. WOLL.

On the factors which influence the fertilizing value of the phosphoric acid of bone meal, H. G. SÖDERBAUM (*Landw. Vers. Stat., 63 (1905), No. 3–4, pp. 247–262*).—Experiments in glass cylinders 50 cm. high and 25 cm. in diameter carried out with oats during 1902 and 1903 are reported. (See also the preceding abstract.) They included comparative tests of superphosphate, dicalcium phosphate, tricalcium phosphate, Thomas slag, Algerian phosphate, apatite, and bone meal alone or combined in various ways with sodium nitrate, ammonium nitrate, ammonium sulphate, and other nitrogenous fertilizers (some organic), the object of the combination being to determine the influence of the different nitrogen compounds on the availability of the phosphoric acid of the phosphates, as has also been done by Prianishnikov (E. S. R., 17, p. 538).

The results show that the bone meal in presence of ammonium salts, as well as of organic nitrogen compounds, gave larger yields than when used in connection with

nitrate of soda alone. Similar results were obtained with Algerian phosphate and precipitated tricalcium phosphate. An increase of yield was produced by mixtures of nitrates and ammonium salts as well as by ammonium salts alone, the maximum increase occurring in case of the latter. The yield of grain was, as a rule, increased more than that of straw, the greatest increase of straw being, as a rule, with applications of organic nitrogen compounds. The increase due to applications of ammonium salts varied widely from year to year with the weather conditions.

Under favorable conditions the total yield was more than doubled, the yield of grain nearly tripled by the bone meal. In case of superphosphate, Thomas slag, and precipitated dicalcium phosphate there was no such increase of yield following the application of ammonium salts. In fact, in some cases there was a decided decrease in yield. When lime was not present in large amounts the bone meal in combination with ammonium salts was fully as effective as superphosphate.

Methods of using untreated rock phosphate, E. T. Meharry (*Ill. Agr., 10 (1906), No. 5, pp. 173–177*).—This is a summary of experiments by the Maryland, Ohio, and Illinois stations on the fertilizing value of untreated rock phosphate.

Manurial value of molasses residue as compared with ammonium sulphate and 40 per cent potassium salts, Lilienthal (*Illus. Landw. Ztg., 25 (1905), No. 34, pp. 319, 320; abs. in Jour. Chem. Soc. [London], 88 (1905), No. 516, II, p. 650*).—The dried molasses residue used in the comparative tests here reported contained 3.5 per cent of nitrogen and 13 per cent of potash, but no phosphoric acid. The residue produced about the same yield of potatoes as the mixture of ammonium sulphate and 40 per cent potash salt, with which it was compared. The quality of the potatoes produced was good.

The development of the potash industry, H. Precht (*Ztschr. Angew. Chem., 19 (1906), No. 1, pp. 1–7*).—A brief review of the history and present status of this industry.

German potassium deposits, W. Schmidtmann (*Amer. Fert., 23 (1905), No. 6, pp. 22–24*).—A brief explanation of the formation of these deposits is given, and a doubt is expressed as to whether like deposits of equal strength and purity exist in any other country.

The use of lime in agriculture, D. A. Gilchrist (*Jour. Bd. Agr. [London], 12 (1905), No. 7, pp. 400–406; Trinidad Bot. Dept. Bul. Misc. Inform., 1906, No. 49, pp. 18–22*).—A summary of available information regarding sources of supply, methods of application, and action of lime in the soil, considered mainly from the British standpoint.

Corncobs as fertilizers and as fuel (*Industrialist, 32 (1906), No. 17, pp. 270, 271*).—Compiled analyses are reported to show that corncobs have very little value as fertilizer (2 lbs. of nitrogen, 0.4 lb. of phosphoric acid, and 6.8 lbs. of potash, worth $1.36) and less than that of barnyard manure, wheat straw, or corn stalks. They are of more value as fuel ($2 per ton if wood is worth $6), and the resulting ashes are rich in potash (about 50 per cent). The feeding of charred cobs to poultry and hogs for tonic or medicinal purposes is recommended.

Dead leaves as a fertilizer (*Mo. Consular and Trade Rpts. [U. S.], 1905, No. 303, p. 276*).—A brief note is given on a report from the U. S. consul at Nantes on the relative fertilizing value of the leaves of different trees. From the results reported it is concluded that 44 lbs. of pear leaves, 80 lbs. of poplar, 51 lbs. of peach, 83 lbs. of locust, 82 lbs. of elm, and 174 lbs. of vine, respectively, are equal in nitrogen to 100 lbs. of ordinary manure.

Hog bristles as a fertilizer, E. Miège (*Jour. Agr. Prat., n. ser., 11 (1906), No. 5, p. 145*).—This material contains about 9 per cent of nitrogen, which is very slowly available in the soil. The improvement of its availability by treatment with superheated steam, acids, etc., or by composting, is suggested. It is stated that gardeners have used the material with success for destroying slugs.

Bat guano from the Federated Malay States, W. R. Dunstan (*Agr. Bul. Straits and Fed. Malay States, 4 (1905), No. 10, pp. 394–397*).—Descriptions and analyses are given of 4 samples of bat guano obtained from caves in different parts of the Malay States. The results show that although these guanos are comparatively rich in phosphoric acid (8.6 to 17.52 per cent), of which a fairly large proportion (3.25 to 9.75 per cent) is soluble in ammonium citrate solution and is therefore in condition to be readily utilized by plants, they are deficient in the very important constituents, potash (0.88 to 2.01 per cent) and nitrogen (0.84 to 2.47 per cent).

Water as a plant food, Backhaus (*Chem. Ztg., 29 (1905), No. 80, p. 1067; Fühling's Landw. Ztg., 54 (1905), No. 22, pp. 757–762*).—Observations made on the Berlin sewage farm during the dry season of 1904 on the value of water as a factor of production are briefly reported, and the actual money value of the increase due to the application of 1 cubic meter of water in case of oats, wheat, hemp, and grasses is calculated. The latter varied from 1.35 cts. in the case of grass to 2.57 cts. in the case of oats.

The conditions necessary to the fullest and most economical use of water in plant production are also discussed, including increasing rainfall by forest planting, storage of water and construction of other irrigation works, deep culture, increasing humus content of the soil, controlling the water content and evaporation, choice of cultivated plants, tillage, etc.

FIELD CROPS.

The breeding of agricultural plants, C. Fruwirth (*Die Züchtung der landwirtschaftlichen Kulturpflanzen. Berlin: Paul Parey, 1905, pp. XVI+201, figs. 25*).—Previous volumes of this work have already been noted (E. S. R., 16, p. 1065). This volume, the third of the series, treats of breeding potatoes, Jerusalem artichokes, flax, hemp, tobacco, hops, and leguminous forage plants, including clovers. Thirty different species are discussed and notes on the blossoming period, pollination, selection, correlation, variation, hybridization, and seed culture are given. A bibliography of 54 references, including books, bulletins, and periodicals, is listed.

Report of work at McNeill Branch Experiment Station for 1904, E. B. Ferris (*Mississippi Sta. Bul. 87, pp. 7–16*).—In a corn fertilizer test the same quantities of nitrogen and phosphoric acid gave practically the same yields when given as cotton-seed meal and acid phosphate, cotton-seed meal and reverted acid phosphate, or raw ground bone. The cotton-seed meal was applied at the rate of 84 lbs., the acid phosphate 232 lbs., the reverted acid phosphate 414 lbs., and the raw ground bone 166 lbs. per acre. In a variety test with corn, Cocke Prolific and Eureka headed the list with yields of 51.6 and 51.5 bu. per acre, respectively.

In a fertilizer test with cotton 126 lbs. per acre each of acid phosphate and cotton-seed meal gave 700 lbs. of seed cotton; 165 lbs. of ground bone, 780 lbs. of cotton; and 168 lbs. of cotton-seed meal and 70 lbs. of acid phosphate, 710 lbs. of cotton per acre. Nearly all other applications gave much lower yields. Among the different varieties tested Allen Long Staple stood first in the production of seed cotton. The average of plats with the rows 4 ft. apart gave 742 lbs. of seed cotton per acre, which was considerably better than was obtained from narrower plantings.

Cowpeas grown as a second crop matured after the rainy season was over and made good hay. It is stated that peas planted early in the season have very little tendency to make fruit, while those planted the latter part of June or in July are likely to fruit heavily. A large and profitable crop of sweet potatoes was grown, the leading variety being Dooly Yam.

In work with sugar cane 420 gal. of first-class sirup was secured on one-half acre of plant cane. Immature tops of cane and tops with only one mature joint were used for planting, but were found unsatisfactory. It is estimated that the yield of

cassava roots secured at the station was at the rate of 15,000 lbs. per acre. Few crops are believed to equal it in tonnage on the sandy soils on which it was tested.

Deep preparation for corn, with shallow cultivation, gave better results than other methods of treatment, while with cotton deep preparation and deep cultivation gave practically the same yield as deep preparation and shallow cultivation. The deep preparation of the land consisted of subsoiling to a depth of 18 in. during the spring of 1903 and plowed to a depth of 5 in. during the spring of 1904, while for shallow preparation the ground was broken 5 in. deep during both seasons.

An inoculated plat of vetch grew to be waist high and was very strong and vigorous, while an uninoculated plat gave very poor results. Notes are also given on rape and Bermuda grass which were grown at the station.

Report of field work done at the [Mississippi] station for 1904, W. R. PERKINS (*Mississippi Sta. Bul. 88, pp. 13*).—Among 10 varieties of short staple cotton the highest total value per acre, $49.02, was produced by Cook Improved. The production of the least remunerative variety, Berry Big Boll, was equal in value to $26.59. John Bull, a long staple cotton, and Cook Long Staple produced values equal to $52.78 and $52 per acre, respectively. It is pointed out that the growing of long staple cotton is not always the most profitable. The different varieties here tested are briefly described.

Ten varieties of corn were tested and among them Hick Improved Marlboro stood first with a yield of 55.8 bu. per acre, followed by Columbian White Mammoth with 52.3 bu. The yields of soy bean hay from 4 varieties ranged from 3,880 to 6,148 lbs. per acre. Yields of Johnson grass hay on 3 different plats varied from 3.75 tons per acre to 5.91 tons. From an average fertilizer application of 87½ lbs. of cotton-seed meal and 100 lbs. of nitrate of soda a profit of $4.93 per acre was secured in growing Johnson grass hay. The experience of the station in growing alfalfa has been that crab grass is likely to kill out the alfalfa plants.

The comparative value of oats, cowpeas, and corn for the production of forage was studied. The value of corn fodder per acre amounted to $14.14, of cowpea hay to $14.63, and of oats and cowpea hay to $16.11.

Report on field crops at the Sugar Experiment Station, Audubon Park, New Orleans (*Louisiana Stas. Rpt. 1905, pp. 3–9, figs. 2*).—It is reported that seedling canes D. 74 and D. 95 have maintained the high standard of previous years. This season D. 74 tasseled in several places in the State as well as in Florida, and it is hoped that seedlings originating in Louisiana may be produced. Promising results secured in tests with cane loaders and harvesters are reported, and it is stated in this connection that D. 74, standing erect and withstanding storms far better than the native canes, presents less difficulty to harvesting with machinery.

Among notes on various crops grown at the station it is reported that maximum yields of 3,162 lbs. of seed cotton and 3,140 lbs. of cured alfalfa hay per acre were secured. .

Cereal investigations (*Kansas Sta. Rpt. 1905, pp. 20–26*).—A description is given of cooperative experiments with the Bureau of Plant Industry of this Department in the testing of newly introduced varieties, and of hybrids and selections of cereal crops.

The work is carried on at McPherson and Fort Hays. Many of the results secured have already been noted (E. S. R., 17, p. 129). The yields of the different varieties of cereal crops grown in 1904 are tabulated and the extent of the plantings for 1905 is outlined. The weather conditions and the growth of the various crops during the season are discussed and the rainfall for the year beginning July 1, 1904, is recorded.

The prevention of lodging in cereals (*Rev. Gén. Agron., 15 (1906), No. 1, pp. 18–21*).—The lodging of cereals is discussed and a method of preventing it described. It was found that on very rich soil by mowing luxuriantly growing grain when 30

cm. high, removing the upper 15 cm., and leaving the cut material as it falls will not only prevent lodging but will also make a more uniform crop in length of straw and size of head and kernel. If after the first cutting the growth of the crop is vigorous enough to indicate danger of lodging, it may be cut again about 2 weeks later when the plants have again reached the height of 30 cm. The mowing should be done when the dew is off, preferably in the afternoon. This method was successfully applied in 1901 on Chevalier barley growing on rich and well-fertilized soil during a warm, rainy season.

Prout's farm, an example of 45 years' continuous culture of cereals without manure, B. SKALWEIT (*Mitt. Deut. Landw. Gesell., 21 (1906), No. 8, Sup. 3, pp. 13–16*).—The general management of the farm, the crop rotations followed, the use of commercial fertilizers, the cost of production, and the value of the crops produced are briefly discussed.

Report on experiments carried out at Bramford and Saxmundham by the East Suffolk Education Committee, T. H. MIDDLETON (*Cambridge Univ., Dept. Agr., 1904, pp. 48, dgm. 1*).—A rotation experiment was conducted to study the effects of different kinds of plant food on common crops. The crops grown in the rotation were roots, barley, clover or beans, and wheat. The fertilizers used were nitrate of soda, superphosphate of lime, and muriate of potash.

The importance and value of these three fertilizers varied with the soil and the crop. On clay soil nitrate of soda was of great value to mangels and of some value to barley; superphosphate, to clover, mangels, and barley, while potash had little or no effect. On light soil nitrate of soda benefited mangels and barley, and muriate of potash mangels and clover; but superphosphate did not benefit any of the crops. The continuous use for 12 years of 2 cwt. of nitrate of soda per acre on the light soil did not deteriorate the land, while a similar use of superphosphate was injurious to mangels and apparently, to a slight extent, to some of the other crops. The continued use of barnyard manure for 12 years on this light soil did not result in any appreciable accumulation of fertility.

In the second rotation experiment the quantities of manures to be used, the time of their application, and their effect were studied. The best results were secured by using 1 cwt. of nitrate of soda and 5 cwt. of superphosphate of lime per acre for the root crop, 2½ cwt. of superphosphate for barley, the same quantity the following season for clover, and 10 tons of barnyard manure for the wheat crop. The experiment further showed that residues of fertilizer applications may have substantial values, varying, however, with the crop. Clover extracted more from residues than barley and barley more than roots. It was shown that clover may receive great benefit from superphosphate applied a year before the crop is sown, while mangels appear to be benefited very little by the same treatment. It was also shown that the residue of any particular application is greatly influenced by the soil. The barnyard manure left a valuable residue on the clay soil and but an unimportant one on the light soil.

The results of experiments on the improvement of poor grass land show that on a clay soil from 5 to 10 cwt. of basic slag per acre is the most profitable application. Potash and lime did not prove profitable. The use of nitrogenous manures in conjunction with phosphates when beginning to improve poor clay soils is not recommended.

A fertilizer experiment with alfalfa showed that on clay soils this crop responds freely to phosphatic manures, remaining indifferent to dressings containing potash, while on sandy soils the potash manures are very effective and phosphates may fail to show improvement.

Variety tests of wheat, oats, and potatoes, G. C. WATSON and N. G. MILLER (*Pennsylvania Sta. Bul. 76, pp. 13*).—The yields of varieties most productive at the station since 1887 are reported.

Of 20 varieties of winter wheat 9 yielded over 31 bushels per acre. The 3 leading varieties, Harvest King, Martin Amber, and Royal Red Clawson, yielded 34.60, 34.58, and 34.22 bu., respectively. The average yield of all varieties was 29.17 bu. per acre. The average of the 13 smooth varieties was 28.86 bu., and that of the 7 bearded varieties 29.74 bu. Dietz Longberry Red and Reliable gave the heaviest weight of grain per bushel, 61.25 lbs. Of the varieties tested for 15 years Fulcaster stands in the lead with 31.13 bu. of grain and 3,821 lbs. of straw per acre.

The 19 varieties of oats grown in 1905 gave an average yield of 56.09 bu. per acre, the range being from 47.80 to 61.50 bu. Czar of Russia ranked first in the production of grain, and Mortgage Lifter, which stood last in grain production, ranked first in yield of straw. In 1904 White Russian was the leading variety, with 77 bu. of grain per acre, while Czar of Russia yielded only 69.13 bu. The yield of White Russian in 1905 was 56.93 bu. per acre.

Forty-three varieties of potatoes were grown this season and an average yield of 187 bu. per acre was secured, but of this quantity 27.4 bu. were unmerchantable tubers. The leading varieties, mentioned in decreasing order of yield, were Eureka, Heath Medium Late Beauty, Uncle Sam, Early Rose, Early Puritan, Extra Early Crusader, Irish Daisy, Early Nancy, and Bliss Triumph, all producing over 200 bu. of merchantable tubers per acre, while the remaining varieties fell below this yield. The average total yield for all the varieties for 1904 was 77.9 bu. more than the yield for 1905.

Crops of southern France, Algeria, and Tunis, C. Rivière and H. Lecq (*Cultures du midi de l'Algérie et de la Tunisie. Paris: J. B. Baillière & Son, 1906, pp. XII + 511, figs. 69*).—This book discusses the culture of tropical and subtropical crops grown in southern France and in northern Africa. The topics discussed are climate, cereal and garden crops, viticulture, forage crops, forestry, fruits, ornamentals, plants furnishing rubber, tannin, dyes, fibers, perfume, starch, oil, etc., and the marketing of fruits and legumes.

Clark method of growing grass for hay, C. D. Woods and J. M. Bartlett (*Maine Sta. Bul. 126, pp. 25–28*).—About 2 acres of land was treated as nearly as possible in accordance with the Clark method.

The results indicated the value of thorough preparation of the seed bed and liberal applications of fertilizer in grass growing. The grass was sown in the fall of 1904 and in July of the next year 6¼ tons of field-cured hay was harvested. This crop cost about $40 for fertilizers and about $37 for labor and seed. The station does not believe this method adapted to Maine, as it does not fit in with mixed farming and rotation of crops, and further, because the seeding formula recommended does not contain clover.

Report on an experiment conducted at Cransley, Northamptonshire, in seasons 1901, 1902, and 1903: The improvement of poor pastures, T. H. Middleton (*Cambridge Univ., Dept. Agr., 1904, pp. 35, dgms. 2*).—The results of cooperative work indicated that to improve poor pastures on clay soils it is advisable to begin with the use of from 7 to 10 cwt. of basic slag per acre. Barnyard manure, sulphate of ammonia, or dissolved bone should not be used in the beginning, but may be applied after the first few years are over. The improvement of soil by clovers and the management of pastures is discussed.

Range improvement, J. J. Thornber (*Arizona Sta. Rpt. 1905, pp. 17–21*).—The range improvement work of the station for the year ending June 30, 1905, with the weather conditions for the period, is briefly reviewed.

A good growth of forage plants on the range reserve is reported, and the prevailing species are enumerated. Two common species of Indian wheat made the best growth, the average height being 10 in. In estimating the relative amount of spring forage on the mesas on small plats from which the plants were pulled up by the roots, dried, and weighed, it was found that the average yield was at the rate of 2,812 lbs. of forage to the acre.

Notes are given on cultural operations, the continuation of work upon the economic cacti, the forage garden, and on the viability of native grass seeds. The different species of forage plants sown on the range reserve and the percentage of germination as determined for a large number of native grasses are enumerated.

Alfalfa, T. F. HUNT ET AL. (*New York Cornell Sta. Bul. 237, pp. 139–177, figs. 10*).—This bulletin is a report of progress on cooperative tests with alfalfa in several parts of the State and of field tests on the college farm. An outline of cooperative demonstrations in the different branches of agriculture to be made in 1906 is appended.

The location and description of soils suited to alfalfa culture in the State are given, and the results of experiments with the crop are discussed. In 63 per cent of the cooperative tests in districts where alfalfa growing is not yet established no nodules at all were found on the plants. During 2 seasons' work with alfalfa bacteria transported by the cotton method, only one case gave an increase of vigor in the plants, while the method of inoculating by the use of soil from an old alfalfa field uniformly resulted in an abundance of nodules.

Dressings of lime usually proved beneficial, and on the heavier soil of the college farm it was found essential to the crop. The use of 2,000 lbs. per acre produced somewhat better results than 1,000 lbs. and practically as good as 3,000 lbs. The results on the heavy soils indicated that the best success is to be obtained by a combination of lime, stable manure, and inoculation by means of soil from an old alfalfa field. On gravelly loam soil alfalfa without a nurse crop grew much stronger before winter set in than that grown with a nurse crop, but this superiority was not maintained in the season's production. During 3 months' storage thoroughly field-cured alfalfa hay lost between 15 and 16 per cent in weight.

Cooperative experiments with alfalfa, C. D. WOODS and J. M. BARTLETT (*Maine Sta. Bul. 126, pp. 35–41*).—Cooperative culture tests with alfalfa in 1904–5 are described and directions given for the culture of the crop. The results thus far secured do not show conclusively that in general alfalfa can be successfully grown in Maine.

Alfalfa and red clover, J. W. WILSON and H. G. SKINNER (*South Dakota Sta. Bul. 94, pp. 16, fig. 1*).—The results of 3 years' experiments with alfalfa and clover at the station and in the forage tests at Highmore are presented.

In the spring of 1904 native sod on the college farm was disked 5 times and part sowed to alfalfa and part to clover, but only the clover made a fair stand. At Highmore a field of Turkestan alfalfa sowed in 1899 still produces good yields. Satisfactory results have been obtained with both the Turkestan and the American varieties. In 1902 a field foul with mustard was sown to alfalfa, with the result that the following year the mustard was practically killed out and a first-class stand of alfalfa was secured.

At the station Turkestan alfalfa sowed May 10, 1903, yielded 5,437 lbs. of hay per acre from 2 cuttings in 1904 and 5,113 lbs. from 2 cuttings in 1905. Montana-grown seed sowed in May, 1903, gave a total yield from 2 cuttings of 5,733 lbs. the following season. The experience in alfalfa culture by farmers throughout the State is briefly noted.

Clover was successfully grown on thoroughly disked native prairie and *Bromus inermis* sod. The seed was sown at the rate of 10 to 12 lbs. per acre and perfect stands were secured. A clover field 1 year old gave a total yield of 5,484 lbs. of hay per acre as compared with 3,294 lbs. on a sod-bound *Bromus inermis* field. In another field a total yield of 9,358 lbs. of hay per acre was secured from clover and only 2,360 lbs. from *Bromus inermis*.

Culture of the fodder beet in Tunis, R. GAGEY (*Bul. Dir. Agr. et Com. [Tunis], 9 (1905), No. 37, pp. 554–560*).—The results of culture experiments with fodder beets are shown in tables.

In selecting a variety or choosing the distance between plants it is recommended that the total quantity of dry matter produced per hectare be taken into account and

not only the percentage. It was found that subsoiling for fodder beets increases the average weight and size of the roots, gives much larger total yields, and decreases the density and the percentage of dry matter, the beets being larger and containing more water. Although the percentage of dry matter is lowered, the total yield is generally increased, especially in dry years. A considerable increase in yield of beets was also secured by irrigation.

Corn culture, R. J. REDDING (*Georgia Sta. Bul. 69, pp. 41–60*).—Twenty varieties of corn tested in 1905 gave an average yield of 38 bu. per acre. The leading varieties, Albemarle and Marlboro, yielded 47.36 and 46.20 bu. per acre, respectively.

Residual effects of fertilizers applied to cotton in 1904 were not apparent in the corn crop of 1905. The plants fertilized this year yielded an average of 30.24 bu. and those not fertilized since 1904, 25.82 bu. per acre. This increase of 4.44 bu. from the use of fertilizers was secured at a cost of 80 cts. per bushel. A second fertilizer test gave similar results and it is concluded that the use of commercial fertilizers is not a reliable means to permanently increase the productiveness of soils.

Applying one-half of the quantity of cotton-seed meal at planting and one-half on May 19 was found inexpedient. Substituting the equivalent in nitrate of soda for one-half the quantity of cotton-seed meal did not prove profitable. As in previous years, cotton-seed meal was more effective than cotton seed applied directly to corn.

Corn improvement, J. A. JEFFERY (*Michigan Sta. Spec. Bul. 34, pp. 23, figs. 17*).—This bulletin is a popular discussion on the improvement of corn by a more careful selection of seed and better cultivation. Directions are given for the selection, storing, and testing of seed corn, and the different cultural operations connected with growing the corn crop. Cross breeding corn for the improvement of quality and the fixation of character are discussed and outlines for judging or scoring corn are given.

Experiment with corn, G. A. CROSTHWAIT (*Idaho Sta. Rpt. 1905, pp. 33–35*).—In 1904 26 varieties secured from various sources were tested and the earliest ears selected for seed. Seed was saved from 9 dent and 2 flint varieties. Only a few ears were secured from each variety making seed, and 5 of those saved were from seed grown near Moscow. In 1905 over 50 varieties were tested and seed selection was made with reference to earliness.

The germination of seed corn, J. W. T. DUVEL (*U. S. Dept. Agr., Farmers' Bul. 253, pp. 16, figs. 4*).—The value of making germination tests is pointed out and complete directions for carrying on the work are given. Percentages of germination of seed corn as determined in individual ear tests of 10 kernels each from the crop of 1905 are shown in tables.

Of 67 lots of corn secured from various sources in different States 60 showed an average germination of less than 95 per cent, 48 of less than 90 per cent, and 10 of less than 80 per cent. The average germination of all ears tested was 86.3 per cent. The poorest lot contained only 2 good ears in 50, with 16 dead ears and an average germination of 39.4 per cent. The best 2 lots germinated 97.8 and 97.3 per cent, respectively, the first lot having 41 good ears in 50 and the second 42 in a possible 49. Of the 3,322 ears tested 1,416 germinated 100 per cent. The average germination of the remaining 1906 ears was only 77.7 per cent. This shows a gain of 13.7 per cent by discarding ears of low vitality.

Experiments with cotton and corn in 1905, J. F. DUGGAR and J. M. RICHESON (*Alabama Canebrake Sta. Bul. 23, pp. 29*).—Among the varieties of cotton grown, Russell and Woodfin gave the largest yields on bottom lands and Woodfin and Peterkin on poor upland. On bottom land Russell produced a crop valued at $55.56 per acre for lint and seed. On poor red upland the value of the crop of Woodfin, the leading variety, was $18.31 per acre in lint and seed, with lint at 11 cts. per pound and seed at 70 cts. per 100 lbs. Subsoiling for cotton which was done when the subsoil was too wet gave unfavorable results. In 2 tests plowing 6½ in. deep resulted in the largest crop, but in 2 other tests no advantage from deep plowing was derived.

The yields of corn were but slightly affected by the method of preparing the soil or planting the crop. Plowing under Egyptian clover and subsequently a crop of cowpeas increased the succeeding corn crop 9 bu. per acre. Corn stover, cotton-seed hulls, or tasseling corn plants plowed under showed no very marked advantage, but the benefits from successive applications of cotton-seed hulls and corn stover became greater each year. Tests made on prairie soils showed that vegetable matter rich in nitrogen, such as is afforded by barnyard manure, sweet clover, and cowpeas, is needed for their improvement.

On poor reddish prairie soils both acid phosphate and cotton-seed meal increased the yield of cotton quite profitably, the increase being 66 lbs. of lint per acre with the phosphate and 40 lbs. of lint with the cotton-seed meal. Kainit was found useless in this fertilizer experiment with cotton. Nitrate of soda, cotton seed, cotton-seed meal, and cow manure, at the rate of 44, 434, 100, and 2,704 lbs. per acre, respectively, used separately, were found profitable for cotton on all grades of prairie land. Acid phosphate did not give decisive results on black slough land but on poor reddish prairie soil this substance and slag phosphate were both found highly profitable. On gray prairie land in good condition the use of 800 lbs. of a complete home-mixed fertilizer, or 8 to 10 tons of barnyard manure gave good returns. Acid phosphate and cotton-seed meal were both more effective when applied before planting. The nitrate of soda gave good results when applied at the first or second cultivation of cotton. Manure from cattle fed on cotton-seed meal and hulls, applied in a small amount in the drill in both cotton and corn culture, increased the yield for each ton of manure about 18 per cent in the first crop after the application, 15 per cent in the second, and 9 per cent in the third, the increase aggregating in value in the 3 years from $4.47 to $11.94 per ton of manure.

Fertilizer applications for cotton and oats are suggested.

Cotton culture, R. J. Redding (*Georgia Sta. Bul. 70, pp. 61–90*).—This bulletin is the report for 1905 on cotton experiments in progress at the station (E. S. R., 16, p. 866).

In the variety test of this year Cook Improved, which ranked first among 30 varieties in total value of crop produced, also stood first in earliness. The value of lint and seed produced by the different sorts ranged from $44.68 to $66.11 per acre. Cook Improved produced 533 lbs. of lint per acre and 880 lbs. of seed, and the next ranking variety, Brown No. 1, yielded 488 lbs. of lint and 767 lbs. of seed. These two sorts were followed by Layton Improved, Moss Improved, Southern Wonder, and Toole Improved, mentioned in the decreasing order of total value produced, and all yielding over $57 worth per acre of lint and seed. The average height of the varieties grown was 3.67 ft., the range being from 3.23 ft. for Jones Re-Improved to 4.18 ft. for Lewis Prize. Moss Improved was the latest maturing variety. The best half of the varieties tested showed a tendency to produce a higher percentage of lint, a somewhat heavier boll, smaller seeds, and earlier maturing plants than the less productive half.

The results of 3 years' fertilizer experiments indicate that when nitrogen is given in the form of cotton-seed meal the best yields are obtained by making the entire application before planting. Such an application bedded on about 2 weeks previous to planting was found to induce early fruiting. From 16 to 20 lbs. of nitrate of soda per acre, applied in the furrow with the seed, has given good returns at the station. Substituting for one-half the quantity of cotton-seed meal its equivalent in nitrate of soda and applying the same as late as June 26 proved profitable. In the experience of the station growing cotton and corn simultaneously on the same ground can not be recommended.

The Mallory plan of preparing land for cotton showed no advantages over the ordinary method. The Mallory plan consists in throwing furrows 8 in. deep at half the distance apart of the intended cotton rows, and running deep subsoil furrows

within the furrows so made. This is done in the fall and the following spring alternate furrows are reopened with a shovel plow and the planting and application of fertilizers performed in the usual way.

A comparison of Peruvian guanos with home mixtures for cotton indicated that the same amounts of available phosphoric acid, nitrogen, and potash in the guanos were of equal value with the same elements in the forms of acid phosphate, cotton-seed meal, and muriate of potash. The results of an experiment with cotton-seed meal and crushed cotton seed, indicated that for fertilizing cotton 865 lbs. of cotton-seed meal is the fertilizing equivalent of 2,000 lbs. of crushed cotton seed.

Suggestions and formulas for the use of fertilizers in cotton culture are appended.

Cotton in Egypt, H. LECOMTE (*Le coton en Égypte. Paris: A. Challamel, 1905, pp. 162, figs. 28, map 1*).—In discussing the present condition of the cotton industry of Egypt, this book devotes a chapter each to general cotton statistics, the soil, climate, varieties, variations, cultural operations, harvesting and ginning, soil exhaustion and fertilization, the distribution of cotton culture in Egypt together with the production and exportation of the country, and the culture of the crop in the Nile region under irrigation.

Hardy Bermuda grass, J. FIELDS (*Oklahoma Sta. Bul. 70, pp. 8*).—Experiments at the station have shown that Bermuda grass should be propagated only from the roots and pieces of sod of a sort that has survived severe winters in Oklahoma. The hardy strain growing at the station and elsewhere in Oklahoma quite generally survived the winter of 1905–6. Directions for planting Bermuda sod and its care after planting are given.

Two and one-half acres of thin upland soil were set to Bermuda grass on June 29 and 30, 1905, by sod planting, and on September 25 a yield of 2,584 lbs. of cured hay per acre, free from weeds and crab grass, was secured. The rainfall during this period amounted to 14.13 in. as compared with an average precipitation of 9.62 in. for the same period in previous years. An analysis of this hay made by the station chemist showed that it contained 9.70 per cent of protein and 1.24 per cent of fat.

The preservation and storage of hops, K. VON BAUR-BREITENFELD (*Pure Products, 2 (1906), No. 3, pp. 145–150*).—Investigations on the storing of hops indicated that hops should be stored in the hop chambers only when perfectly dry and ripe for bagging, and that sulphuring maintains the quality during storage.

The storage rooms should be kept at an even low temperature and perfectly dry. Temperatures from zero to 2 or 3° R. preserve hops better than higher temperatures because they reduce the moisture in the air to a greater extent and retard the oxidation of the hop resin and oil. The lower temperatures also better preserve the flavor of the hops. Hop chambers with direct refrigeration and stagnant air are as effective as those cooled by circulating cold air.

The potato crop, T. H. MIDDLETON (*Cambridge Univ., Dept. Agr. Farmers' Bul. 3, pp. 54*).—Variety tests were conducted in 1903 and 1904 on a light loam soil. The best yields were secured from Dobbie Factor and Findlay Royal Kidney. Sutton Discovery and Findlay Evergood proved the most resistant to disease.

The sprouting of seeds before planting did not appear very useful for ordinary purposes. Planting entire tubers gave better results than the use of cut seed pieces. Tubers weighing 9 or 10 to the pound, or 1½ to 1⅝ in. in size, were most suitable for planting. Seed imported from Scotland produced equally good crops the first and second years, while the third year the crop was much reduced. The second growth induced by weather conditions in 1904 had a very injurious effect on the cooking quality of the potatoes.

The best results on poor light land were secured with a fertilizer application consisting of 1¼ cwt. of sulphate of ammonia, 3½ cwt. of superphosphate, and 1½ cwt. of sulphate of potash. On a light loam soil the best yield was secured where this same application of commercial fertilizers, together with 12 tons of barnyard manure per acre, was used. The barnyard manure alone also gave good results.

Report on experiments with potatoes, 1905, W. Bruce and J. Porter (*Edinb. and East of Scot. Col. Agr. Bul. 9, pp. 25, dgm. 1*).—Among 13 varieties of potatoes tested the second time Factor, Pink Blossom, and Up-to-Date were the only ones which yielded a heavy crop of fair quality. Of the medium early varieties King Edward VII was the most productive, being followed by White Blossom and British Queen. Some of the old standard varieties proved of equal value with the best of the new ones.

Sprouting the seed potatoes in boxes before planting increased the yield as well as the size of the tubers. Sprouted seed planted May 5 produced a better crop than unsprouted seed planted April 14.

On sandy soil the use of commercial fertilizers with barnyard manure was profitable, and on one of the test plats a complete commercial fertilizer gave better results than incomplete applications, although sulphate of potash alone gave a satisfactory return. Sulphate of ammonia gave a larger increase in yield than nitrate of soda. For sandy loams the use of 1 cwt. of sulphate of ammonia, 3 cwt. of superphosphate, and 1½ cwt. of sulphate of potash, given with a medium dressing of barnyard manure, is recommended.

Trial of varieties of potatoes, G. E. Adams (*Rhode Island Sta. Bul. 111, pp. 61–74*).—The fertilizer formulas used during a period of 7 years in potato experiments are given and the average yields of varieties for the number of years grown are shown in tables.

The range in yield of the 85 varieties under test was from 426 bu. per acre, the 3-year average of the Great Eastern, to 67.7 bu. per acre, the 2-year average of Rival. The total crop of Astonisher, Gem of Aroostook, and Prof. Dr. Maercker showed a maximum variation of only 0.9 of a bushel, yet in the percentage of merchantable tubers there was a variation of 26.4 per cent of the entire crop. A similar relation was observed between Commercial, Early Maine, and German Early Rose, the difference in yield of merchantable tubers in these 3 varieties being equal to 49.9 bu. per acre. In observing the disease resistance of varieties Prof. Julius Kühn showed the greatest immunity from injury by the blights. The selection of early-maturing varieties is considered as apparently the only safe plan to be followed to keep the crop free from blight.

Potatoes were sprayed 4 and 5 times during the season. Sixteen varieties gave an increased yield of over 50 per cent of the total crop as due to the additional spraying. Fifteen varieties showed an increase of from 25 to 50 per cent, 12 yielded from 1 to 25 per cent greater crops, while 8 varieties showed an apparent loss from the last spraying. The plants of the 15 varieties giving the greatest increase in yield remained vigorous and continued to grow from 2 to 3 weeks longer upon the area sprayed 5 times than upon the area sprayed only 4 times. Peerless Junior, State of Maine, Burbank, White Star, and Vermont Golden Coin, sprayed 5 times, retained from 90 to 100 per cent of their foliage for more than 3 weeks after the plants sprayed only 4 times were dead.

Home-mixed fertilizers for potatoes, C. D. Woods and J. M. Bartlett (*Maine Sta. Bul. 126, pp. 41–44*).—The details of experiments here reported have been previously noted (E. S. R., 16, p. 1073). In 1905 three home-mixed fertilizers were compared with one commercial potato fertilizer and the results, on the whole, were lower with the home-mixed than with the commercial fertilizer. The results are considered as not admitting of conclusive interpretation at the present time.

Ramie and similar crops in India, G. B. De Cardo (*La ramie et ses analogues aux Indes Anglaises. Paris: A. Challamel, 1906, pp. 123*).—This book is a translation and a résumé of information on the culture and preparation of ramie and other analogous fiber plants in India. The information here given is taken from the Dictionary of the Economic Products of India, by G. Watt, published from 1889 to 1893.

Field observations upon the tolerance of the sugar beet for alkali, G. W. Shaw (*California Sta. Bul. 169, pp. 29, figs. 20*).—Previous work along this line,

described in earlier publications of the station (E. S. R., 8, p. 683; 12, p. 942), is briefly summarized. The later observations here recorded were made by the author at Grand Junction, Colo., in 1900 and at Oxnard, Cal., in 1904.

The investigations in Colorado indicated that in the virgin soils under test the heavy percentage of alkali lies above the fourth foot, and that the excessive amounts found in the upper foot have been brought there from that depth by shallow irrigation and by the upward leaching of the soil due to seepage. The average of 8 soluble salt determinations upon soils producing either good or fair crops of beets shows a percentage of 0.036 of chlorids, 0.004 of carbonates, and 0.087 of sulphates, or a total of 0.127 per cent in the upper foot of these fields. These figures correspond to 1,440 lbs. of chlorids, 160 lbs. of carbonates, and 3,480 lbs. of sulphates, or a total of 5,080 lbs. of soluble salts in the upper acre-foot. The yields of beets ranged from 7.76 tons to 20.98 tons, or an average of 8.45 tons per acre, with an average sugar content of 16.03 per cent and a purity of 81.8.

Soils producing poor crops of beets under the same conditions of cultivation and treatment were found to carry much more chlorid in the top foot than was held in the upper 3 ft. of the soils producing fair crops. These data are regarded as showing that the soluble salt content of the soil is the primary cause of the failure of beets, but it is pointed out that the high percentage of alkali is not uniform throughout the locality, and that by proper selection of soils these difficulties may be avoided.

The strength of the soil solution was determined as based on 20 and 10 per cent of moisture in the soil. It was found that the heavy adobe soil 2 days after irrigation contained from 18 to 20 per cent of water, while several days after irrigation the moisture content had fallen from 8 to 12 per cent and the plants were suffering from lack of water. As shown by the analyses made, the solution in soil with 20 per cent of moisture contained 2.97 per cent of alkali, and with 10 per cent of water in the soil 5.86 per cent. It is pointed out that when the density of a soil solution becomes too great the vitality of the seed is destroyed or, in the case of already growing plants, the passage of water from the soil into the plant is checked.

At Oxnard, Cal., observations were made in fields with a marked unevenness of stand, which frequently characterizes beet fields on alkali soils. The results on all the different fields pointed to the fact that wherever the chlorid content of the soil approached 0.20 per cent beet culture was unsuccessful. It was further shown that the sulphates had a comparatively limited effect on the growth of beets. The effect of the different salts is more clearly brought out in the following table:

The effect of different percentages of soluble salts on the growth of sugar beets.

Condition of beets.	Sulphates.	Carbonates.	Chlorids.	Total salts.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*
No growth	0.4063	0.0092	0.1957	0.6112
Poor	.3602	.0000	.0742	.4344
Fair	.2010	.0044	.0746	.2800
Good	.2629	.0101	.0419	.3149

On this particular field the sugar content of the beets ranged approximately from 17 to 22 per cent.

In certain portions of these fields where good beets were produced, practically all the alkali was found in the top foot of soil, where it could have little or no effect on the more delicate feeding roots of the plant, while on adjacent spots producing no beets the concentration of the alkali was essentially the same in the first and the second foot of soil, bringing it within reach of the fibrous-feeding roots. These results are regarded as indicating that the distribution of the soluble salts within the soil may be a more important factor than the total quantity of alkali present, and

also as explaining why beets fail to grow in certain places although little or no alkali appears near the surface. The failure of plants, even though the seed germinated well and a good stand was originally obtained, is also accounted for by this fact. In these observations fair beets were found growing in soil with an average of 4,000 lbs. of chlorids per acre-foot, and it was noticed that certain individuals have a much greater resistance to alkali than others. It is believed that the success of beet culture in regions with alkali soils depends upon the proper soil selection and the development of a more alkali-resistant beet.

Sugar beets in the San Joaquin Valley, G. W. Shaw (*California Sta. Bul. 176, pp. 27, figs. 11*).—The results of field observations and analyses connected therewith since 1902 are reported.

In 1902 the average results of 9 tests showed a sugar content in the beet of 14.9 per cent and a purity of 83.5, but the average yield was only 4.74 tons per acre. These figures are regarded as showing that the general climate and soil conditions are suitable for the production of high-class sugar beets. The low tonnage was largely due to late planting. A satisfactory yield can be obtained only by early planting, which will allow the plants to make considerable growth before the hot weather of the summer months.

These conclusions were confirmed by results obtained in 1905. It is also stated that, in general, the results will be very unsatisfactory when the beets are grown without irrigation. The failure of the plantings of 1905 was primarily due to late planting and inadequate irrigation, and in a lesser extent to poor soil preparation, poor cultivation, and beet blight. General discussions on the climatic conditions, moisture and sunshine requirements, and on soils and their preparation and cultivation are given, and the results of earlier experiments conducted by the station with sugar beets in southern California are reviewed in an appendix.

Manurial experiments with sugar cane in the Leeward Islands, 1904–5, D. Morris (*Imp. Dept. Agr. West Indies, Pamphlet 39, 1906, pp. 51*).—A summary of the results with seedling and other canes at the experiment stations in the Leeward Islands is given.

At Antigua the results showed that the canes B. 156, Sealy Seedling, B. 306, B. 208, D. 74, D. 95, and D. 109 are specially worthy of attention. The ratoons of 6 of these canes also ranked first at the various stations. In St. Kitt's Caledonian Queen and White Transparent gave the best results, while the Barbados seedling canes B. 208 and B. 147 were also satisfactory. The ratoon crop of B. 208 ranked first with a yield of 30 tons of cane and 8,508 lbs. of sugar per acre in the juice.

Relating to the sugar industry in Peru, T. F. Sedgwick (*Trujillo, Peru: Haya, Verjel & Co., 1905, pp. 78, pls. 11, charts 3*).—This book contains descriptions of the sugar districts and sugar estates in Peru and a review of the methods of sugar-cane culture in that country, together with a brief discussion on the manufacture of cane sugar and the utilization of by-products. Comparative data from different sugar-growing countries are also given. Special reference is made in this work to the sugar estate known as Hacienda Cartavio.

Germination of seeds as affected by nutrient salt solutions, O. Kamberský (*Ztschr. Landw. Versuchsw. Oesterr., 9 (1906), No. 1, pp. 33–43*).—Work along this line by several investigators is reviewed, and results of experiments at the seed control station at Troppau are reported.

Of each of 15 different field crops 400 seeds were soaked for 48 hours in a solution of a mixture of ammonium and potassium nitrate and sodium and ammonium phosphate. For the purpose of a check test the same number of seeds of each crop were soaked in water for the same length of time. When these samples were subjected to a germination test the seeds soaked in the nutrient salt solution did not sprout so quickly and, with the exception of sugar-beet seed, did not show as high a percentage of germination as the seed soaked in water.

The various crops showed different degrees of resistance, which is believed to be partly due to the age of the seed, although it was observable in fresh seed with a weakened vitality. All degrees of vitality were represented in each individual sample, and it is concluded that the weakest seeds lost their power to germinate when soaked in the salt solution, while in the resistant seeds the germination was delayed. It was also found that the parts of the embryo were differently affected, the plumule appearing more resistant than the radicle. Seeds of grains taken from the germinating chamber and transferred to fresh soil continued their growth normally, but were retarded as compared with seeds not treated with the salt solution.

Seed inspection, C. D. Woods and Bessie G. Tower (*Maine Sta. Bul. 125, pp. 26*).—This bulletin contains the text of the Maine laws regulating the sale of seeds, and the results of analyses of samples of seeds collected by the station in 1905 and received from correspondents from 1902 to 1905. A list of weed seeds from the samples tested is given and attention is called to the free analysis of weeds, seeds, fertilizers, and feeds by the station.

HORTICULTURE.

Department of agriculture and horticulture, V. A. Clark (*Arizona Sta. Rpt. 1905, pp. 10–15*).—Attention is called to the intense heat and light in Arizona and the effect of these on plant growth. Shading has been found a specific for many crops which are injured or even killed in the open. Where the summer heat raises the surface soil to so high a temperature as to interfere with root growth mulching has been found a specific remedy. Deep planting of trees has also been practiced successfully to overcome this trouble.

The results secured at the station with a number of fruits and vegetables during the season are briefly stated. Guavas have been successfully grown, both in the open and in shade, and withstand a temperature of 19° F. The McNeal variety of garden pea was less injured by frost than the American Wonder variety. A study is being made of varieties of olives in Arizona. No insect nor fungus pest has been found as yet to attack this crop.

Some alfalfas from Sahara and Arabia promise to surpass the strain commonly raised at the station in growth during the hot months. The yields of 3 varieties of durum wheats in comparison with the Sonora variety are given. In every case the yield was considerably higher, and the straw, though taller, showed less tendency to lodge. It also rusted much less. Pea plants from light-weight seed died as a result of weather conditions a number of days earlier than from heavy seed. It is believed that considerable valuable work can be done along the line of seed selection.

Report of the horticultural department, J. Troop (*Indiana Sta. Rpt. 1905, pp. 19–21*).—An outline of the experimental work of the department during the year, with some of the chief results obtained. In the use of pedigreed strawberry plants the results of a single season's work indicate clearly that "the pedigree theory as applied to strawberry plants has been overdone."

In some fertilizer experiments with tomatoes great differences in the productiveness of individual vines, due to individuality, were observed. In spraying experiments it is found just as essential to spray for the second brood of codling moth as for the first brood. San José scale has been found in 44 counties of the State. A new aphid was discovered during the summer of 1904, which seems to be especially partial to Houghton gooseberry bushes. The aphid is briefly described and has been given the name of *Aphis houghtonensis*.

Fruits and vegetables, E. B. Ferris (*Mississippi Sta. Bul. 87, pp. 3–7*).—An account is given of the commercial culture and marketing of a number of varieties of fruits and vegetables, including potatoes.

The best results with strawberries have been secured with the Klondyke variety. The most effective fertilizer was a mixture made up of 200 lbs. of cotton-seed meal, 400 lbs. of acid phosphate, and 100 lbs. of kainit. The yield with this fertilizer was at the rate of 191.6 crates per acre. These results with berries, as with all the other crops experimented with, showed that the soil is lacking in phosphoric acid. On account of the scarcity of labor and poor shipping conditions the northern limit of successful marketing was Birmingham and Chattanooga. The best shipping package was a 24-qt. ventilated crate. The returns from 275 24-qt. cases netted a little less than $500.

Asparagus was marketed most profitably in Chicago. Twenty ⅓-bu. boxes gave a net return of $30. When commercial fertilizers were used on cabbage, the increase over unfertilized plats was 223 per cent, and 299 per cent on soil that had been parked with cattle. The normal fertilizer used on this crop was 430 lbs. of cotton-seed meal, 420 lbs. of acid phosphate, and 200 lbs. of kainit. When either the cotton-seed meal or acid phosphate was decreased the crop was lessened, but when the kainit was decreased the yield remained practically the same.

Wardwell Kidney Wax beans averaged 120.8 bu. per acre, and Improved Valentine 121.6 bu., counting 30 lbs. to the bushel. The use of kainit was without effect in increasing the yield of this crop, but both nitrogenous fertilizers and phosphates gave marked increased yields. The unfertilized soil yielded 66 bu. per acre. When fertilized with a mixture containing 209 lbs. of cotton-seed meal, 114 lbs. of dried blood, 455 lbs. of acid phosphate, and 213 lbs. of kainit the yield was 150 bu. per acre. One-half of this fertilizer mixture gave a yield of 121.5 bu. per acre. When the nitrogen was left out of the mixture the yield was 82 bu. per acre. Acid phosphate alone produced a yield of 104.5 bu. per acre. The net returns from shipping 2 acres of beans to northern markets was $173.29. The bushel hamper was a much more desirable package for this crop than the bushel box.

Burbank was the heaviest yielding variety of potato grown, producing 182.5 bu. per acre. Native seed produced but 70.6 bu. per acre, while with at least 5 varieties from other sources the yield was in no instance less than 126.8 bu. per acre. The net returns from 2 acres of potatoes were $112.

A test was made with different sized seed pieces, varying from 1 eye to whole medium sized tubers. The yield with one-eye pieces was 68.9 bu. per acre, and this was gradually increased to 107.9 bu. when whole potatoes the size of a guinea egg were used. Among other vegetables grown were onions, beets, radishes, kohl-rabi, turnips, ruta-bagas, eggplants, and peppers. The only ones profitably marketed were beets, ruta-bagas, and turnips.

Further studies in lettuce culture, W. Stuart (*Vermont Sta. Rpt. 1905, pp. 292–296, pl. 1*).—In an earlier report (E. S. R., 17, p. 249), an account was given of an experiment to determine the comparative value of different forms of chemical fertilizers, the relative value of chemical fertilizers and rotted manure, and the relative influence of surface *v.* subwatering for lettuce. In the present instance a report is made on flat-grown *v.* bench-grown plants; and combination indoor and outdoor lettuce culture.

In the first experiment plants were grown in flats until ready for market. The flats were 12 by 16 by 3.5 in. One dozen plants were grown in each. Similar plants were grown in benches at a distance of 8 by 8 in. apart. The bottom of the flats was filled to a depth of 1.5 in. with well-rotted manure. Thirty-four square feet of space were given to each method of culture.

The plants in the flats were ready for market a week in advance of those in the bench. Their average weight was 86 gm., while those in the bench averaged 210 gm. each. The flat-grown plants presented a good appearance and sold for 40 cts. per dozen, while the bench grown plants commanded but 50 cts. per dozen. From the

standpoint of space, therefore, the returns per square foot were 26 cts. from flat-grown plants and but 10 cts. from bench-grown plants.

The conclusion is drawn that for local market conditions a greater net profit can be made from lettuce planted in flats. The growing of the plants in flats to maturity considerably lessens the labor required, though the lettuce is not so heavy nor so good by close planting as when sufficient space is allowed for development.

In the combination indoor and outdoor lettuce culture, lettuce was started in the greenhouse and transplanted to the open as soon as weather conditions permitted. Good crops were thus secured. The average weight of the plants of a number of different varieties grown for 2 years is tabulated. Iceberg gave the heaviest yield in each of the 2 years. It is believed that seedlings could be grown equally as well in the hotbed as in the greenhouse for this work, and that in the vicinity of the station this method of culture would be very profitable.

Fertilizer experiments in field culture of garden peas (*Maine Sta. Bul. 126, pp. 30–34*).—Garden peas were grown for a cannery on 2 farms. Part of the peas grown was inoculated with pure cultures of nitrogen-fixing bacteria from the Department of Agriculture and from commercial sources. Commercial fertilizer was used on both farms. A severe drought seriously interfered with the experiment.

On one farm the soil was found to be thoroughly inoculated with the nitrogen-collecting bacteria, and the use of pure cultures was without additional benefit. On the other farm which, so far as known had never been planted to peas, some of the plants on the inoculated plats were found to contain tubercles on the roots, but no more than on some of the other plants which were not inoculated.

The cassaba melon (*Pacific Rural Press, 71 (1906), No. 10, p. 148*).—The history of this muskmelon, also known as Winter Pineapple Muskmelon, is given, with an account of its introduction into the United States, and the methods observed by the author in its culture. This is a late melon, suitable for Christmas use, and grown to some extent as a stock food.

Report of culture experiments in 1905 on the sewage fields of Berlin, J. Klar and O. Mende (*Gartenflora, 55 (1906), Nos. 2, pp. 35–40; 3, pp. 66–70*).—The results are given of tests in growing large numbers of flowers and vegetables, with brief comments on the various varieties.

Soil sterilization, W. Stuart (*Vermont Sta. Rpt. 1905, pp. 297–299*).—A historical account is given of the development of soil sterilization by means of steam and otherwise in this country, with an account of the author's investigations in sterilizing soil in solid beds and subwatered benches.

"Three in. drain tiles were sunk about 10 in. below the surface of the soil. The lines of tile were laid every 16 in., each line being independent of the other and connected with the surface by a vertical section of draintile." When steam was properly connected and turned in the tile at a pressure of 40 to 60 lbs., a bed containing approximately 70 sq. ft. of surface could be heated up to about 210° F. in about 3 hours' time. When the surface soil was well covered with burlap, the heat was maintained at this temperature for a long time, and was entirely effective against nematodes. This method of soil sterilization involves less labor than the usual method of sterilizing in boxes, as there is no handling of soil and the draintiles are far enough below the surface to be out of the way of cultural operations.

A large portion of the bench surface in the greenhouse is fitted for subwatering by means of galvanized iron pans and layers of porous brick. An attempt was made to sterilize the soil in this bench by injecting steam into the pan through the watering tube. The result was unsatisfactory, as too much steam was required. Much of the steam condensed in coming in contact with the cold porous bricks, and it is believed that it would be more economical to employ a sterilization box in the treatment of soil in subwatered benches.

How to use a planting plan, I. G. Tabor (*Gard. Mag. [N. Y.], 3 (1906), No. 3, pp. 146, 147, chart 1*).—A complete chart is given for planting a 50 by 100 ft. lot. The plan shows the kind of trees, shrubs, and flowers to plant, just where each one should be planted, and the method of transferring a planting plan to the ground.

Blossoming of fruit trees, L. B. Judson (*Idaho Sta. Rpt. 1905, pp. 23–32, charts 3*).—The blossoming season of a large number of varieties of apples in different parts of Idaho in 1904–5 are tabulated, as well as the blossoming season for 12 varieties of pears and 5 varieties of peaches for the season of 1905.

On the winter injury of apple trees, W. Stuart (*Vermont Sta. Rpt. 1905, pp. 299, 300, pls. 2*).—A further note is given on the injury to apple trees during the winter of 1903–4, mentioned in an earlier report of the station (E. S. R., 17, p. 249). The winter-injured trees after blossoming and partially leafing out apparently stopped growth and the unfolded leaves shriveled and died. Later in the season many of the trees pushed out into new growth, usually at the base of the scaffold limbs, or somewhat higher up.

Experiments were undertaken to see if the trees would not be benefited by pruning. A number of eight-year-old Rhode Island Greenings were severely pruned back, others less vigorously handled, and some not pruned at all. It was thought that the severe pruning of the trees on which new growths were being pushed out at the base of the limbs would tend to throw the strength of the tree into a few branches, and thereby induce greater growth and a more shapely head. The orchard was not given good cultivation.

The growth made on the differently handled trees is shown in a series of illustrations. "A careful study of this series of photographs affords little evidence that pruning was beneficial." As a result of the investigations, the author recommends that pruning operations be deferred to the latter part of the growing season or the following spring, rather than immediately after such winter injury as noted in the experiment. Severe pruning is inadvisable.

Influence of stock on scion, W. Stuart (*Vermont Sta. Rpt. 1905, pp. 300–305*).—In 1899, 5 classes of plums were root grafted on 4 types of stocks. The stocks used were Americana, Wayland, Marianna, and Peach, and the scions were Stoddard of the Americana group, Green Gage of the Domestica group, Chabot of the Japanese group, Milton of the Wild Goose group, and Newman of the Chicasaw group.

The results secured with this combination of stocks and varieties in Maryland have been previously noted (E. S. R., 14, p. 1069). The present report covers the results secured in Vermont from 1900 to 1905. Tabulated results given in the report show that 93 per cent of the varieties on Americana roots lived, 100 per cent on Wayland, 80 per cent on Marianna, and 40 per cent on Peach. The average diameter of the trunk of the trees produced on these different stocks is shown in the table below, the measurements being made at the collar and 1 ft. above the collar:

Trunk growth of varieties of plums on different stocks.

Variety of plum.	Americana.		Wayland.		Marianna.		Peach.	
	Collar.	Foot above.	Collar.	Foot above.	Collar.	Foot above.	Collar.	Foot above.
	Inches.	*Inches.*	*Inches.*	*Inches.*	*Inches.*	*Inches.*	*Inches.*	*Inches.*
Stoddard	2.00	1.75	1.69	1.32	1.69	1.44	.....	.....
Green Gage	2.38	2.19	2.72	2.56	2.69	2.50	2.50	2.31
Chabot	2.50	2.31	3.19	2.00	2.72	2.53	.....	.....
Milton	2.41	2.00	2.50	2.22	3.28	3.19	1.03	.88
Newman	3.03	2.69	3.16	2.97	3.03	2.97	2.88	2.75
Average	2.46	2.19	2.65	2.41	2.68	2.53	2.14	1.98

"These measurements show that Stoddard on Americana gives the greatest average diameter of the trunk, with Marianna and Wayland about equal. Green Gage did best on Wayland, with Marianna a close second, Peach and Americana being third and fourth, respectively. Chabot was best on Wayland and second best on Marianna. Milton was far superior on Marianna than on any other, Wayland and Americana occupying second and third places. Newman did well on all stocks, but was slightly superior, in diameter at least, on Wayland, followed by Marianna, Americana, and Peach in the order named. . . . Stated briefly, Americana seems best for Americana; Wayland for the Japanese; Milton for Marianna, with little choice between Wayland and Marianna for the Domestica group, and no marked choice between any of the four stocks for the Chicasaw group."

The influence of Wayland stock on Milton variety is given special mention. On Wayland the Milton grew more or less upright, while on Marianna the head was low, bushy, and spreading. The variety Newman made especially good growth on Peach roots, and it was suspected that roots might have been sent out by the scions. Some of the trees were dug up, but in only one instance was this found to be true, and this exception is not considered of any vital importance.

"A comparison of the root systems showed the Peach to be the deepest rooted and least spreading. Marianna and Wayland possessed numerous spreading and rather shallow lateral roots. Americana, while having a spreading lateral-root system, was not as symmetrically developed as were the two former. In none of them could the root system be said to be much superior to that of Peach stock." Milton on Marianna stock was much more seriously affected by "plum pocket" than when grown on Wayland or Americana. Whether it was due to stock or not could not be told.

Hybrids in their relation to grafting and wines (*Bul. Agr. Algérie et Tunisie, 11 (1905), Nos. 23, pp. 524–530; 24, pp. 550–557*).—The essential part of this article is an address delivered by L. Daniel before the Viticultural Society of Lyons, in which he reviews his work on grafting in the improvement of grapes, and points out its practical application.

It appears that the best French varieties of grapes can not be improved from the standpoint of the fruit by grafting, but may be improved from the standpoint of resistance. The case is different with hybrids, where opportunity for amelioration by grafting is much greater, since not only can the resistance to phylloxera be thus increased, but the crop greatly modified.

Variations produced by grafting seem often to be hereditary in the vine. It may thus happen that many old varieties may be materially modified in time. In order to avoid this, it is recommended that experimental vineyards be established in which the old French varieties of grapes, which have been originated with such great care, may be preserved in their purity.

Variation by grafting, G. Bonnier (*Fermes et Châteaux, 1 (1905), No. 4, pp. 6–8, figs. 5*).—A popular and somewhat extensive review of the work of L. Daniel on grafting between different species of plants, and on the hybrid variations obtained. The review covers the results of the grafting experiments noted more at length in earlier numbers of the *Record*.

Study of the cider apples of Sarthe, P. L. C. Cassarini and E. Poupard (*Bul. Mens. Off. Renseig. Agr. [Paris], 5 (1906), No. 2, pp. 157–179*).—A general account is given of the cider regions of Sarthe, and of the varieties of apples used in cider production. The various varieties are described in considerable detail, and a table given showing the vigor and hardiness of different varieties when grown on the various soils of different regions, the yields obtained, quality of fruit and cider made from it, with analyses of the ciders.

Olives and citrus fruits (*Louisiana Stas. Rpt. 1905, pp. 9, 10*).—During the year 1 variety of olive, Pensulina, produced fruit which was successfully pickled. The fruit is of fine flavor and medium size. It is believed that these are the first olives to be grown to maturity and pickled in Louisiana. Citrus hybrids produced by

this Department by crossing *Citrus trifoliata* with sweet oranges have withstood a temperature of 18° F., the coldest weather at the station since they were planted.

Varieties of dates of Tagant and Adrar, R. Arnaud (*Bul. Agr. Algérie et Tunisie, 12 (1906), No. 3, pp. 60, 61*).—A list is given of the species of dates grown in these regions, the names being given in both French and Arabic, and comments added as to the usefulness of some of the varieties.

Tropical fruits on the Florida Keys, P. J. Webster (*Fla. Agr., 33 (1906), No. 9, pp. 161, 162*).—An account of the methods of culture of the tropical fruits grown on the Florida Keys, including pineapples, avocado, mangoes, sapodillo, bananas, sugar apples, soursop, custard apples, eggfruit, papaw, pomegranate, etc.

Miscellaneous fruit notes, W. Stuart (*Vermont Sta. Rpt. 1905, pp. 305–309*).—Tables are given showing the blossoming, leafing out, and ripening periods of plums and cherries for the years 1903 to 1905, inclusive. The data show a close relationship between the time of flowering and the time of fruiting. Recommendations as to the best varieties of plums and cherries are given.

Growing fall bearing strawberries, S. Cooper (*Amer. Agr., 77 (1906), No. 13, p. 429, fig. 1*).—The Pan-American and Autumn varieties of strawberries that bear fruit in the fall are described and methods given for their cultivation. In the case of the Pan-American variety it is stated that by judicious cultivation and systematic removal of the early blossom stems this variety will continue to bear until the green berries are frozen. An illustration is given of the plant in blossom and fruit.

The transportation of fruit in refrigeration, G. H. Powell (*Cal. Fruit Grower, 33 (1906), Nos. 919, pp. 1, 3; 920, p. 5*).—A paper presented before the American Society of Refrigerating Engineers at its meeting in New York, December 4, 1905, in which the losses that occur in shipping perishable fruits in refrigerator cars are discussed.

Where fruits are shipped from the orchard without first cooling and are from 3 to 10 days in transit, large losses occur, particularly in the top tiers of fruit. The problem to be overcome is to secure refrigeration which will be sufficient to cool down all parts of the car sufficiently to prevent the development of decay, either by improved methods of car refrigeration or by cooling down the fruit before it is placed in the refrigerator car. Coupled with these requirements is the necessity of having the car refrigeration simple so that an ordinary brakeman could manipulate it satisfactorily.

The cocoanut and its relation to the production of cocoanut oil, H. S. Walker (*Philippine Jour. Sci., 1 (1906), No. 1, pp. 58–81, pls. 10*).—This is a report of an extensive study of cocoanut production from the standpoint of quality and quantity of the oil yielded.

Analyses are given of the seashore and interior soils on which cocoanuts grew successfully, and of nuts picked at varying stages of ripeness, nuts from different localities, and nuts grown on both sandy soils and clay soils. It had been noticed that cocoanut trees growing near the seashore at San Ramon produced much more fruit than trees standing farther inland. Analyses showed the inland soils to be somewhat superior in the elements of fertility to the seashore soils, but were much less permeable.

The following table shows the fertilizing constituents contained in the husk, shell, meat, and milk of cocoanuts:

Analyses of cocoanuts.

Part.	Nitrogen.	Potash.	Phosphoric acid.
	Grams.	*Grams.*	*Grams.*
Husk	1.609	3.915	0.017
Shell	.660	.947	.459
Meat	4.683	2.475	1.740
Milk	1.542	1.313	.171
Total	8.494	8.650	2.387

It is calculated that 1 hectare of land on which 173 trees are growing will produce a total of 7,000 nuts per annum, and that each tree will lose annually 16 leaves, weighing about 3 kg. each. From these data it is calculated that the total annual drain on the soil per hectare from growing cocoanuts is as follows: Nitrogen, 91.12 kg.; potash, 135.37 kg.; and phosphoric acid, 41.38 kg. Based on these data and the analyses of seashore soil it is calculated that the seemingly barren seashore soils on which cocoanut trees are growing so vigorously contain sufficient nitrogen to produce crops for 307 years, sufficient potash for 1,478 years, and phosphoric acid for 677 years, not taking into account the probable inexhaustible supply of plant food constantly coming down in the seepage water from the interior hills. While irrigation and fertilizing may be of considerable value to trees in the interior, on the seashore irrigation would be of value only in dry seasons, and fertilizers would probably be washed away before they could be used by the trees.

The analyses of the nuts at different stages of growth are given in an extensive series of tables. They show that there is no indication of meat or fatty material in the nut until it has reached its maximum size and the shell is completed. With the formation of the shell the milk becomes rather sweet, and a slimy, pulpy mass, having a sweetish taste and comparatively little oil, begins to deposit on the inside, chiefly on the lower half of the nut. Gradually it extends over the whole of the inside of the nut, becoming denser and thicker and increasing in oil content at the expense of the sugar in the milk. This hardening process continues often in ripe nuts for 2 or 3 months after they have been picked from the tree, or until the nut sprouts.

With the appearance of the sprout the fat stored up in the nut is transformed into sugar and other bodies, and the embryo gradually increases in size until it occupies the whole space inside the nut and utilizes all the nourishment contained therein for its growth. In order, therefore, to secure the largest yield of copra and oil, only thoroughly ripe nuts should be used, and the author states that it is often advisable to allow these to stand in a dry place for a few weeks before they are opened. By the use of green nuts it is shown that there may be a loss of almost 50 per cent, while if nuts are stored for more than 3 months there is a loss due to germination, and often before that time nuts which have been cracked or bruised in gathering become rancid.

Analyses of different colored nuts—golden yellow and light green, both of which turn brown at maturity—show practically no difference in composition. The quality of nuts grown on the seashore, contrary to general statements, was not found to be superior to those taken from trees farther inland. Among 1,000 nuts from the seashore, gathered at random, 55 were found in bad condition, while out of the same number, gathered from the interior, only 15 were spoiled. This difference, it was thought, was due to the harder grounds along the seashore and the consequent greater bruising in falling.

Analyses are given of nuts from Davao. One variety was from trees producing large nuts, rather pointed in shape, and the other from trees bearing small, rounder fruit. The percentage of oil in the nuts free from husks was found to be about the same in both cases.

The seed grower, C. Johnson (*Marietta, Pa., 1906, pp. 191, pl. 1*).—This book, believed by the author to be the first of its kind published in any country, gives detailed directions for the production of all the different kinds of vegetable and flower seeds commonly grown in the United States. A section is also devoted to bulbs and shrubs. The usual field-crop seeds, such as clover, wheat, etc., are not considered. Suggestions for originating new varieties, forms of contracts made by seed growers with seed dealers, cultural hints for the ordinary garden crops, germination, color, and vitality of seeds, and descriptions of a number of the more prominent varieties of each of the different vegetables are included.

The author states that to a large extent America still depends upon European growers for the best quality of beet, cabbage, carrot, cauliflower, kale, kohl-rabi, leek, parsnip, parsley, radish, turnip, spinach, and onion seeds, and the choicer grades of flower seeds and bulbs. America satisfactorily produces pea, bean, celery, cucumber, lettuce, melon, and certain kinds of onion seeds, as well as all the more usual field-crop seeds. Much the larger amount of flower seed produced in the United States is grown in California.

FORESTRY.

History of the lumber industry in America, J. E. Defebaugh (*Chicago: Amer. Lumbermen, 1906, vol. 1, pp. XIII+559*).—A large amount of material is here brought together relative to the history of the lumber industry since the discovery of America. Twenty-three of the 31 chapters deal with the industry in Canada. In one chapter the forest geography of North America is considered. In the 6 chapters devoted to the industry in the United States one is concerned with the forest resources, one with the public land policy in its relations to lumbering, one to forestry and forest reserves, one to tariff legislation, one to lumber production, and one to foreign trade.

Forestry statics, a handbook for the advanced sylviculturist, H. Martin (*Die Forstliche Statik. Ein Handbuch für leitende und ausführende Forstwirte sowie zum Studium und Unterricht. Berlin: Julius Springer, 1905, pp. XII+361*).—Part 1 of this work deals with the principles and methods of forestry statics, and part 2 with their application. The various chapters of part 1 take up the production of wood volume through accretion, the value and uses of wood, the production and cost of forests, and the net profits. The work is intended for the use of students and teachers.

Handbook of the timber trade, L. Hufnagl (*Handbuch der kaufmännischen Holzverwertung und des Holzhandels. Berlin: Paul Parey, 1905, pp. VIII+318, figs 28*).—This book treats of the different commercial grades of lumber and timbers, the commercial uses of different kinds of timbers, transportation of timber, etc.

Forestry problems in the United States, T. P. Ivy (*Boston: The Archway Bookstore, 1906, pp. 47*).—The author criticises present methods of conducting civil-service examinations for positions in the forestry service, discusses the effect of the Reserve Act of 1891, which he believes has had the result of considerably increasing the price of lumber and forest products, and urges more extensive sylvicultural operations in the East. As a means of broadening our forest administration he suggests a board of forest conservators of at least 7 members. A discussion is also given of the Mississippi River in its relation to forestry.

Future forest trees, A. H. Unwin (*London: T. Fisher Unwin, 1905, pp. 108, pls. 3*).—There are 3 chapters in this book, the first dealing with the German timber imports from the United States and Canada; the second with the general results of planting experiments with American trees in Germany, Austria, Great Britain, and Switzerland, and the third with the sylvicultural characteristics and treatment of the various American species of trees. The purpose of the book is to present in a concise manner the results of European experiments with imported American trees, most of which are ornamental, for the benefit of English forestry.

Forestry division, K. A. Carlson (*Orange River Colony Dept. Agr., Ann. Rpt., 1 (1904–5), pp. 45–123*).—This gives an outline of the forestry work of the division for the year, with an account of the forest reserves, individual plantations, nurseries, revenues, expenditures, etc.

About 2,700 acres are under the control of the forestry division, on 93 of which plantings have been made. The forestry division recommends that candidates be sent by the government to Yale College to take the 2 years' course of forestry. It is believed that forestry conditions in America are more nearly like those in South

Africa than elsewhere. The cost of the course is less than half that of the English course, and it can be completed in 2 instead of 3 years, as in Europe.

About 2,000,000 cu. ft. of timber was imported into the Colony in 1903, while the average yearly importation is about 700,000 cu. ft. It is estimated that the cost of establishing timber areas in the Colony, carried out on the scale of at least 2,000 acres per annum, would be about $50 per acre, spreading over a period of 30 years.

Report forest department of the Madras Presidency for 1904-5 (*Admin. Rpt. Forest Dept. Madras, 1905, pp. 167*).—This is a progress report covering the constitution of the state forests, their management and administration during the year, and financial results. The appendixes contain details regarding the acreage of forest areas in the different districts and circles, lands under settlement, forest tracts protected from fire, the outturn of timber, fuel, and bamboo, revenues derived from different sources, etc.

Notes on the effects of frost on trees at the government nursery, Irene, L. E. Taylor (*Transvaal Agr. Jour., 4 (1906), No. 14, pp. 325–329*).—Three methods were employed to protect trees known to be tender to frost during the winter. These were plant shelters, large screens, and covering with Hessian cloth. The plant shelters were the most effective, and were made of rough Eucalypt poles and thin branches. A framework was built of the poles about 6 ft. high, and over this thin branches were laid at intervals of about 1 to 2 in. Although the shelters do not keep out frost, they lessen its severity by preventing radiation, which is the cause of most damage to trees during the winter. The behavior of about 90 species toward frost is mentioned in detail.

Planting white pine in Vermont, L. R. Jones (*Vermont Sta. Bul. 120, pp. 67–80, figs. 7*).—An account is given of forestry conditions in Vermont, with directions for starting a pine forest, either with seeds, natural seedlings or nursery stock, and the after care to be given it.

On the University farms an experimental tree plantation was made some 8 years ago on a dry, sterile, sandy soil, originally covered with pitch pine. The trees planted were black locust, red oak, white birch, chestnut, cottonwood, box elder, European larch, Norway spruce, and white pine, but only locust and white pine have given promise of profitable return. There is some doubt as to whether locust will be able to survive the attacks of borers, but the white pine has proved an unqualified success. White pines that have been planted for 8 years now stand 7–9 ft. high and have made a growth of 2–4 ft. the last 2 summers.

The starting of a forest by sowing seed broadcast is believed to be a hazardous undertaking. Special attention is called to the fact that the year 1904 was a pine-seed year and that there is an abundance of 1-year-old seedlings now in the State, and that these may well be used for forestry purposes. On a small scale the trees may be obtained from nurseries. The estimated cost of producing trees in a nursery is placed at $2 per 1,000. Maple trees can be bought for about half the price of white pine trees, and it is therefore more economical to plant about half and half maple and pine. Pines grow as well as in pure stands, and as soon as they overtop the maples they will kill out most of them. This will occur in about 20 years, and if this natural thinning is not sufficient the maples should be cut out.

The catalpa tree for cross-ties (*Arboriculture, 5 (1906), No. 3, pp. 69–81, figs. 8*).—This is a report of F. I. Brown, as chairman of the Committee on Roadway and Ballast of the Pennsylvania Railway, on the use of the catalpa tree for cross-ties, and is essentially a compilation of information on the value of *Catalpa speciosa* for lumber, posts, ties, etc.

The value of cultivated rubber to the manufacturer (*Trop. Agr. and Mag. Ceylon Agr. Soc., 25 (1905), No. 5, pp. 657–659*).—This paper was prepared by C. P. Fox, of Ohio, and is reprinted from the *India Rubber Journal*, August 28. It contains an account of experiments with a large number of varieties of rubber to deter-

mine their tensile strength. The data obtained are tabulated and the following conclusions drawn:

"Ceylon fine, when used to denote the oriental source of fine Para, means a grade lacking in uniformity when the tensile strength is considered. The curing qualities of Ceylon fine indicate that it has a decidedly slower action than the South American product. A future paper will show this difference more clearly. Mill deportment indicates that all of these oriental samples are much softer and are less nervous than the occidental types."

The spiral system of rubber tapping, I. ETHERINGTON (*Trop. Agr. and Mag. Ceylon Agr. Soc., 25 (1905), No. 5, pp. 641–646, pl. 1*).—A description of the spiral system of tapping worked out by C. Northway and E. D. Bowman on the Deviturai Estate in the Southern Province of Ceylon. This method of tapping is used on *Hevea brasiliensis*. It is employed only on trees which have a girth of 18 in. or more 3 ft. from the ground, or when about 5 years old.

The first time trees are only lightly tapped up to a height of 4 ft. from the ground, starting 1 ft. from the base of the tree. The first process is to mark the place for the spiral cut. This is done in stenciling ink with a sheet-tin guide. On young trees at the first tapping 2 spirals only are cut parallel and 1 ft. apart, each spiral going once around the tree. The spiral cuts are made at an angle of 45° or more; the younger the tree, the greater should be the slope. On older trees the spirals are continued up the tree to 6 ft. high or more.

The first cut in the trunk is made with a special knife, which is used as if it were a plane. The following day the cut is reopened with a paring knife having a steel spring, which works against the trunk to prevent cutting the cambium. On alternate days the shaving knife is replaced with a pricking tool, which is a small revolving spur fitted on a handle. This is run along the edge of the spiral cut, puncturing the bark close against the previous day's wound and along the wound surface. The object of the pricker is to save cutting away the bark so quickly. When the shaving knife alone was used it was found that 2 in. width of bark was cut away in one month, and when the pricker was used on alternate days only 1 in. of bark was removed per month. The flow of latex produced by the pricker seems just as full as that produced by cutting the bark.

The average yield of rubber by the V system of tapping on the estate was 1 lb. per tree per annum and by the spiral system 5 lbs. per tree per annum. In 1903, 248 trees of various girths gave 240 lbs. of rubber by the V tapping. These same trees the following season by spiral tapping yielded 1,317 lbs. of rubber. The tapped trees appear to be less injured under the spiral system than under the old V system of tapping.

In the case of young trees it is believed that tapping should not start until the trees begin to flower; that is, the fifth year. The labor required under this system is about 5 trained coolies per acre. Each cooly can tap about 400 lineal feet or 720 in. of girth per day, or 30 to 40 trees.

The yields from the trees noted above were obtained on swampy land not believed to be especially suited to rubber production. It is stated that this system of tapping is rapidly being extended.

Ceara rubber in Brazil (**Manihot glaziovii**), A. MOLLAY (*Un arbre à caoutchouc du Brésil, le Manisoba. Paris: A. Challamel, 1906, pp. 31, figs. 16*).—A botanical description is given of this species of rubber, with an account of its culture in Brazil, including methods of extracting the latex, and the production of hard rubber.

Sapium aucuparium in Ceylon (*Trop. Agr. and Mag. Ceylon Agr. Soc., 25 (1905), No. 3, pp. 173, 174*).—It is stated that this tree is grown in Ceylon under the name of *S. biglandulosum*. It grows to a height of about 40 ft. and seeds freely. In tapping experiments the latex dried to a brittle resinous substance and planters are advised to wait and see what products can be obtained by mixing the latex of this

species with that of Para rubber before planting extensively. Other species of Sapium found growing in Ceylon are *S. indicum*, *S. insigne*, and *S. sebiferum*. The seeds of the latter are coated with "tallow," which is used in the place of animal tallow for the manufacture of candles, soap, etc.

Species of forest trees in Soudan, M. CONSTANCIA (*Les essences forestières du Soudan, propres à la construction. Paris: A. Challamel, 1905, pp. 68*).—Descriptions are given of the various forest trees of French Soudan, with an account of their usefulness for various purposes.

Philippine wood oils, A. M. CLOVER (*Philippine Jour. Sci., 1 (1906), No. 2, pp. 191–202*).—A chemical study was made of the oils obtained from a number of Philippine woods. The principal oils studied are the oil of Supa, obtained from the tree *Sindora wallichii;* Balao, or oil of Apitong, derived from various species of the genus *Dipterocarpus*, the chief use of which appears to be in calking small boats and as a protective varnish for woods; and Malapaho, or oil of Panao, from the tree *D. vernicifluus*.

DISEASES OF PLANTS.

Incomplete experiments for 1905, L. F. HENDERSON (*Idaho Sta. Rpt. 1905, pp. 14–22*).—Brief accounts are given of a number of experiments which are in the main incomplete. The investigations included spraying for the prevention of apple scab and codling moth, combating pear blight and tomato blight, destruction of dandelions, spraying for the prevention of rose mildew and rose aphis, and spraying for the elm aphis.

The spray for the prevention of apple scab and codling moth consisted of Bordeaux mixture, to which was added some form of arsenical preparation, but the results were negative, no marketable apples being found in the orchard at the end of the season.

In the experiments with pear blight the wounds made by cutting out diseased portions of the trees were covered with a mixture consisting of sulphur and carbolic acid. This was used quite liberally in covering the wounds, and there seems to be some evidence to indicate that its use was followed by good results. The experiments with tomato blight were practically a failure, although plants from seed placed directly in the field where they were to stand were somewhat more promising than others.

In the eradication of dandelions the author applied kerosene, brine, and gasoline to the plants, and where gasoline was applied the dandelion was killed without any injury to the grass. The other treatments were not wholly efficient in destroying the weed and the grass was often destroyed for several inches about the point of application. A number of mixtures were tested for combating the rose mildew and aphis, the best results being obtained where whale-oil soap and potassium sulphid were combined.

Spraying for the prevention of elm aphis consisted of winter or early spring treatment with the lime-sulphur spray, and where well applied the trees were protected against injury. Thorough applications must be given the trees, so as to reach all the eggs, which are deposited in crevices of rough bark, especially toward the base of the trees.

Indiana plant diseases in 1905, F. D. KERN (*Indiana Sta. Bul. 111, pp. 133–134*).—A résumé is given of the plant diseases observed in Indiana in 1905, the data being compiled chiefly from reports by correspondents made in response to a circular letter sent out by the station.

The summary indicates the prevalence of the more important diseases and estimates the extent of injury as compared with the previous season, whenever possible. The various crops are taken up and under each are listed the diseases observed, and where any are known, methods are given for their prevention. Formulas are given for the preparation and use of fungicides in connection with combating plant diseases.

The occurrence of plant diseases in Vermont in 1904, L. R. Jones and W. J. Morse (*Vermont Sta. Rpt. 1905, pp. 267–271*).—Data are given showing the mean temperature, rainfall, number of clear and cloudy days, etc., and the authors call attention to the close relationship between plant diseases and weather conditions.

Brief notes are given on a number of diseases observed during the period covered by the report, particular attention being given to those of the potato, and 2 new leaf spot diseases are described. The first of these diseases made its appearance early in July, a few plants showing small black spots on the leaves, which suggested the presence of early blight. Upon closer observation it was seen that the blackening began on the under side of the veinlets and spread more rapidly along the veins than laterally. No fungus was detected in connection with the spotting. One hill of affected potatoes was dug and the root system, tubers, and bases of the stem seemed sound. The other infected plants were kept under observation until the death of the plants in September. The spots gradually enlarged, still bearing a close resemblance to the early blight, but remained sterile.

In the authors' judgment it is a nonparasitic disease, involving the plant as a whole, the local spotting of the disease being merely a symptom. It is believed to be the same disease observed by one of the authors in Germany and also in England, and a similar trouble was noticed on specimens of the Mexican *Solanum polyadenium* in the horticulturist's potato collection.

The other disease appears to be unrecorded in this country and was first noticed on early planted Early Rose potatoes. The plants exhibited obscurely defined pale yellow spots $\frac{1}{8}$ to $\frac{1}{4}$ in. in diameter, and the lower surfaces of the spots were covered with a delicate gray growth, evidently a Cercospora. In the gross appearance of the spots and in its occurrence and destructiveness the disease was much like that caused by *Cladosporium fulvum*, which was developing at the same time on neighboring tomato plants. This disease spread during July to another variety of potatoes in an adjacent plat and showed slight development in other plats later in the season. It caused considerable damage from hastening the death of the vines of the earlier potatoes, but did no appreciable harm on the later varieties.

The fungus is being studied to determine its specific and cultural characters.

The part taken by teleutospores and æcidia in the distribution of maize and cereal rusts, J. C. Arthur (*Proc. Soc. Prom. Agr. Sci., 26 (1905), pp. 94–98*).—Attention is called by the author to the recent discovery of the æcidial stage of corn rust on the common wood sorrel (*Oxalis* sp.).

Hitherto this form of the rust had not been known and knowledge of the life history of the fungus remained incomplete. Having discovered the æcidial stage of the rust, this gap is filled, but the author states that the usual infection is probably through the blowing of the uredospores from the regions where the corn is not completely killed by frost. The blowing northward of these spores may cause successive infections in new localities as the season advances, and thus spread the rust throughout the country. In addition the germinating teleutospores reach plants of Oxalis, from which direct infection to the corn plant becomes possible.

The distribution described above for the corn rust is said to apply almost equally well to some of the rusts of other cereals.

Rust problems, H. L. Bolley and F. J. Pritchard (*North Dakota Sta. Bul. 68, pp. 607–676, figs. 30*).—An account is given of rusts of cereals and other plants, the principal aim of the bulletin being to provide a compendium of the theories and known facts involved in the rusting of cereals and other important farm crops, to give the lines and results of new observations and experiments, and to cite investigations and farm practices which give promise of future success in combating or preventing crop destruction by these fungus pests. The authors describe various forms of rusts, giving an account of their effect on the host plants, the alternate generations of a number are mentioned, and accounts given of the method by which the fungus is carried over from one season to another.

Among the recent observations, attention is called to the fact that in connection with shriveled grains the authors found spore beds containing both uredospores and teleutospores beneath the bran layer, and this seemed to indicate that possibly the wheat rust could attack the plant directly from the seed. Infected seed generally may be recognized by black-pointed grains, the black points being situated at the germ end of the grain. A number of seeds of this character were planted in glass cases, but the resultant plants did not show any rust. If later experiments should confirm this possible mode of rust propagation, new light may be thrown on the entire rust problem, and the importance of proper seed selection would be shown.

Suggestions are given as to precautionary measures to be taken by farmers in order that the amount of rust may be reduced as much as possible. These include the thorough drainage of fields, the early and even maturity of the crop, thorough preparation of the soil and the use of clean seed, the selection of seed of pure varieties, treatment for prevention of smut so as to insure healthy plants if possible, keeping down weeds and volunteer plants which may carry the rust, destruction of all barberry shrubs, thorough grading of seed grain, and the rotation of crops.

Plant diseases, J. J. THORNBER (*Arizona Sta. Rpt. 1905, pp. 21, 22*).—Brief notes are given on the alfalfa leaf spot (*Pseudopeziza medicaginis*) and the common grain rust (*Puccinia graminis*).

Notes on Puccinia graminis, J. JOANNIDES (*Trans. and Proc. Bot. Soc. Edinb., 23 (1905), pt. 1, pp. 63–67*).—The author records observations on the occurrence of *Puccinia graminis* in Egypt and describes the continued existence of the rust during several years without the usual presence in the life cycle of the teleutospore condition and the subsequent æcidial stage on the barberry.

Culture experiments with rust fungi, H. KLEBAHN (*Ztschr. Pflanzenkrank., 15 (1905), No. 2, pp. 65–108, pl. 1, figs. 4*).—Notes are given on experiments carried on by the author during 1903 and 1904 with some 30 species of rust fungi.

Among the data given are special references to the wintering of *Puccinia dispersa;* the specialization of *P. digraphidis;* the alternate hosts of *P. stipæ;* the specialization of *P. caricis;* notes on *P. polygoni amphibii, P. violæ,* etc.; a new form of *Uromyces dactylidis;* the specialization of *U. scirpi;* notes on *Gymnosporangium clavariæforme* and *G. juniperinum;* the relationship between *Ochrospora sorbi* and *Æcidium leucospermum;* infection experiments with *Cronartium ribicola* on white pine, etc.

Helminthosporium gramineum and Pleospora trichostoma, F. NOACK (*Ztschr. Pflanzenkrank., 15 (1905), No. 4, pp. 193–205, pl. 1*).—A report is given of the investigations of the author on the possible relationship between these two species of fungi, and he agrees with Diedicke (E. S. R., 16, p. 64) in holding that *Pleospora trichostoma* is the perithecial form of *Helminthosporium gramineum*, the cause of the stripe disease of barley.

Investigations with *H. teres* and *H. avenæ* have thus far failed to reveal their perithecial stage.

The prevention of stinking smut of wheat and loose smut of oats, W. T. SWINGLE (*U. S. Dept. Agr., Farmers' Bul. 250, pp. 16, figs. 7*).—The author describes means for the prevention of the stinking smut of wheat and loose smut of oats, the methods detailed being the treatment with sar, which consists of a mixture of sulphur, alkali, and resin; the bluestone or copper sulphate and lime treatment; formalin treatment; and hot-water treatment. Directions are given for the use of these fungicides and for the handling of the grain after treatment.

The smut of wheat, C. MACÍAS (*Com. Par. Agr. [Mexico], Circ. 27, pp. 4*).—A brief account is given of smut of wheat, with directions for its prevention.

Disease resistance of potatoes, W. STUART (*Vermont Sta. Bul. 122, pp. 167–178, dgms. 4*).—In previous publications (E. S. R., 17, pp. 262, 670) accounts are given of studies of disease resistance of potatoes. The present bulletin gives the results of investigations on the resistance of vines to blight and tubers to rot. Investigations

were also carried on upon the resistance of tubers to scab, but the results so far obtained are inconclusive.

More than 150 varieties of potatoes were brought together from Europe and this country and planted under identical conditions, some being planted in clay loam and others in sandy loam. Frequent observations were made as to the presence of diseases and the relative amount of infection. There was some evidence that some of the varieties on the sandy loam were more disposed to the early blight, due to *Alternaria solani*, than others. The same is true of resistance to tip burn.

The principal investigations, however, were in connection with the late blight (*Phytophthora infestans*). This disease made its appearance about August 10 on Delaware and Green Mountain varieties, spreading slowly, the weather conditions during August not being propitious for its rapid development. The results of the investigations of the foliage are tabulated, from which it appears that a marked difference was to be observed in varieties. The resistance that is claimed for *Solanum commersoni* to late blight was found to be unwarranted under the conditions of the experiments.

In connection with the investigations on the resistance to potato rot a careful examination was made of all tubers as soon after digging as possible, and a list of the American varieties showing the greatest resistance to rot on the sandy and the clay loams is given. Keeper, American Wonder, Dakota Red, Doe Pride, and Late Blightless were the most resistant in both sandy loam and clay loam. The comparative rot resistance of European and American varieties is discussed, and it was found that on both sandy and clay loam the Dutch, German, and English-Scotch varieties showed much less rot than did the French and American varieties. While disease resistance is important, the commercial standards of this country favor qualities in which the German and Dutch varieties are inferior to the American varieties, and at present the writer does not feel warranted in recommending them to American growers.

The relative susceptibility of varieties which form their tubers deep or shallow was investigated, it having been claimed that those forming their tubers near the surface are more subject to rot than others, and while some differences might be noted, yet in both classes of soil about the same proportion of each was affected.

Potato diseases and their remedies, L. R. Jones and W. J. Morse (*Vermont Sta. Rpt. 1905, pp. 272–291*).—In continuation of investigations reported in a previous publication of the station (E. S. R., 17, p. 261) accounts are given of spraying experiments, relation of date of digging to development of potato rot, relation of storage conditions to development of rot in potatoes, studies regarding the time and method of tuber infection by the rot fungus, and gaseous disinfection for potato scab.

The spraying experiments, which were conducted for the prevention of both late blight and rot, were carried on in the field. Bordeaux mixture, consisting of 6 lbs. of copper sulphate, 4 lbs. of lime, and 40 gal. of water, with the addition of ½ lb. of Paris green, was employed, 2 applications of the mixture being given the plants on August 2 and 21, respectively. At the expiration of the season the tubers were dug, and the gain at the rate of 161 bu. per acre is attributed to the application of the fungicide. The authors present in tabular form the gains from the use of Bordeaux mixture on late potatoes, covering experiments for the past 15 years in which the average gain for that period is 119 bu. per acre due to the treatment.

In a previous report (E. S. R., 14, p. 1084) the authors called attention to the method by which the spores of the fungus are carried from the leaves to the tubers, and suggested spraying the soil with Bordeaux mixture for preventing this infection. The previous trials were repeated in 1905 with good results, and the investigations show that not only does the disease pass from the leaf to the tuber, but the main channel is through the soil rather than through the stem. Spraying experiments for the control of the early blight showed the effect of thorough application of the fungicide,

the increased yield being attributed to the beneficial effects of the Bordeaux mixture, not only in checking the development of the fungus, but in deterring insect attacks.

In investigations on the relation of the date of digging to the development of the potato rot, results quite different from those previously reported (E. S. R., 17, p. 261) were obtained. In 1905 there was a greater loss from later digging than from earlier, and this is at variance with the previous rule laid down that digging should be deferred as long as possible where the rot is expected. In the authors' opinion this rule will have to be modified by making an exception of heavy wet soils during wet seasons.

Experiments were carried on to test the effect of liming, disinfection with formalin, sun-drying the tubers, and the temperature of storage on the development of rot in potatoes. It was found that instead of being an advantage in the preservation of tubers, the application of lime actually favored the development of rot. Disinfecting with formalin was without any material effect in checking it. In testing the relation of moisture to the development of rot it was found that potatoes exposed as much as practicable to sun and air prior to storage are less subject to rot than those stored immediately. The various temperatures of storage investigated were 40, 53, and 70°, and the greatest proportion of the crop saved was at the lowest temperature.

In studying the time and method of tuber infection different lots were subjected to different treatments. One lot was exposed for 36 hours to infection from blighting tubers immediately after digging, a second lot was not artificially infected but kept moist for 36 hours, and a third lot was stored without treatment immediately after digging. The relative loss was 92 per cent where the tubers were infected and not washed, 100 per cent where infected and washed, 77 per cent where not infected but kept moist for 36 hours, and 54 per cent where stored at once without any treatment. Concerning the possibility of spread in the storage cellar, it was found that spores may be produced in storage, and that well ripened sound tubers were readily inoculated with the fungus spores. From this it appears that there is no doubt as to the possibility of infection of tubers in storage.

In continuation of trials of gaseous disinfection for potato scab (E. S. R., 17, p. 261), the authors tested the relative value of gas treatment as compared with soaking seed for disinfection against scab, and also the merits of different ways of generating the gas. All the methods of disinfection showed marked gains in smooth tubers, but none of them gave a crop wholly free from scab. The average results obtained with the vapor treatments were better than those secured where the seed tubers were soaked in formalin solution, and the authors are led to recommend treatment of seed tubers with formalin gas by the permanganate method without the addition of steam. The cost of this treatment would be approximately $1.50 per 1,000 cu. ft., and this method is recommended only for those seed potato specialists who may wish to disinfect large quantities of tubers.

Concerning disease resistance of potatoes, L. R. Jones (*Vermont Sta. Rpt. 1905, pp. 264–267*).—A brief account is given of investigations carried on by the author in connection with the Bureau of Plant Industry of this Department regarding the resistance of potatoes to various diseases, a preliminary report on which has already been issued (E. S. R., 17, p. 60).

The potato leaf curl (*Jour. Bd. Agr. [London], 12 (1905), No. 8, pp. 476–478, fig. 1*).—A description is given of the potato leaf curl or early blight (*Macrosporium solani*), and its occurrence is noted on *Solanum commersoni* grown at Kew.

Sal Bordeaux for potato blight, C. D. Woods and J. M. Bartlett (*Maine Sta. Bul. 126, pp. 34, 35*).—In a previous publication of the station (E. S. R., 16, p. 1093) it was shown that dry Bordeaux as a fungicide was inferior to Bordeaux mixture as usually applied.

In 1905 an experiment was carried on to test the value of a dust spray known as Sal Bordeaux. This consists of equal parts of lime and exceedingly finely ground

copper sulphate, and it is applied as a dust on the theory that as soon as this dust becomes moist, from dew or otherwise, the regular Bordeaux mixture in concentrated form will be produced on the foliage. A number of plats received treatment with this fungicide at the rate of 3, 6, and 10 lbs. per acre. There was no blight on either the treated or untreated plats, so the results are considered inconclusive, and it is planned to repeat the experiment in 1906.

In connection with these experiments Paris green was used to prevent the ravages of bugs, and where it was applied in connection with the dry powder it was not as efficient as where the insecticide was administered in the form of a spray.

Further experience in asparagus rust control, R. E. Smith (*California Sta. Bul. 172, pp. 21, figs. 7*).—In continuation of experiments previously reported (E. S. R., 16, p. 66; 17, p. 48), the author gives an account of experiments carried on in California and elsewhere to control the asparagus rust, the principal information in the present publication being based on the results of practical work of various growers, especially observations made in connection with a ranch at Milpitas, Cal.

At this ranch the asparagus cutting was stopped about the first of July, and the rust was less abundant than usual on the uncut tops, but developed very vigorously after the beds grew up. An especial effort was made to keep down the wild growth about the edges of the field, which had in previous years caused a large amount of infection. After the end of the cutting season and the usual plowing and cultivation, the field was irrigated in order to start as vigorous a growth as possible. About August 1 heavy dews occurred, and the first application of sulphur was made. A special form of apparatus was employed, and sublimed sulphur at the rate of about 100 lbs. per acre was applied. Three weeks later a second application was made, and a third was given after a second interval of about 3 weeks.

The results of the treatment were quite apparent from the condition of the treated field. All untreated fields in the neighborhood were badly rusted in September and the tops were black and dead in October, while the field receiving the sulphur made a fine growth and the plants remained green until the normal end of the season. The cost of the treatment was at the rate of $6 per acre for the season's work on 75 acres, and from the experience obtained it was thought possible to reduce this cost to about $4 per acre for future treatments.

Other growers in the same locality applied sulphur to asparagus, and the results obtained were in proportion to the efficiency of the application. Near Sacramento attempts were made to control the rust with liquid sprays, and where Bordeaux mixture alone was used the effect on the rust was very slight. When sulphur was used in connection with the sprays, much better results were obtained, and based upon the trials of a number of growers, the following treatment has been adopted for future use: Three weeks after cutting, the plants are to be sprayed with whale-oil soap and water, followed by a dusting of sulphur at the rate of about 150 lbs. per acre. One month later sulphur is dusted over the plants at the rate of about 200 lbs. per acre, the applications to be made on dewy mornings.

The author cites illustrations of the use of sulphur for the control of the asparagus rust in other localities in California and also in South Carolina, where the treatment proved eminently successful.

In applying the sulphur the chief requisite is to scatter it so that it will cover all the growth in a dusty, smoky cloud. Experiments with ground and sublimed sulphur and flowers of sulphur showed that when all things are considered the flowers of sulphur is the most satisfactory and economical.

In conclusion the author states that in treating asparagus it is necessary to get a good coating of sulphur on the tops just before the rust is due to appear. A second application should be made 1 month later, and a third after another interval of about 4 weeks. Where young beds of asparagus are to be protected from rust, the author recommends a special form of treatment, which consists of spraying the

plants with whale-oil soap, to be followed by an application of sulphur, scattered by hand.

White rust of cabbages (*Jour. Bd. Agr.* [*London*], *12* (*1905*), *No. 8, pp. 480, 481, fig. 1*).—A brief account is given of the occurrence of *Cystopus candidus* on cabbages. As the white rust most frequently occurs on shepherd's purse, it is recommended that all weeds of this kind should be destroyed in the vicinity of other crops that are liable to be infected by the fungus.

Tomato diseases in California, R. E. SMITH (*California Sta. Bul. 175, pp. 16, figs. 8*).—A preliminary report is given on the cause, nature, and possible means of prevention of some diseases of the tomato which have become exceedingly destructive in parts of California, and the further investigation of which is to be prosecuted in connection with the work of the new pathological laboratory for southern California.

The diseases described are the damping-off, which is due to one or more species of fungi, the summer blight, which is attributed to attacks of an undetermined species of Fusarium, and the winter blight, which is caused by the fungus *Phytophthora infestans*. For the damping-off, which is most prevalent in seed beds, the use of fresh earth, thorough ventilation, and the avoidance of overcrowding the plants are recommended as precautionary measures, and spraying with Bordeaux mixture, followed by sprinkling with sulphur, is advised where the disease has become established.

For the summer blight, which is due to a soil fungus, the only recommendation that can be made at present is planting healthy plants in new soil. Applications of lime, sulphur, etc., to the soil may be tried, but the effect of such treatment has not yet been demonstrated. Spraying can probably be of no use in connection with this disease. For the prevention of the winter blight, which occurs only after heavy rains or heavy fogs and dews, and in California affects only the winter crop of tomatoes, spraying after every rain with Bordeaux mixture is recommended.

A Fusarium disease of tomatoes, E. VON OVEN (*Landw. Jahrb., 34* (*1905*), *No. 3–4, pp. 489–520, pls. 2, fig. 1; abs. in Centbl. Bakt.* [*etc.*], *2. Abt., 15* (*1905*), *No. 15–16, pp. 491, 492*).—In 1901 and again in 1904 there appeared on tomatoes in the vicinity of Berlin a disease that became epidemic, causing considerable losses of the fruit.

Upon the blossom end of both green and ripe fruit appeared black spots that enlarged, and, through the softening of the underlying tissues, gave a wrinkled appearance to the fruit, which finally became a dried mummified mass. An investigation of the material showed there was a fungus in the tissues, and also abundant bacteria. Subsequent studies seemed to show that the bacteria were of secondary importance, finding entrance only after the destruction had been begun by the fungus.

The cause of the disease is said to be a species of Fusarium. The fungus appears to be usually a wound parasite, under normal conditions not being able to penetrate the epidermis of the fruit, but when especially abundant and vigorous in growth it seems to cause infection.

The author describes the results of inoculation experiments with the organism, which seems to be an exceedingly variable one, and which survives the winter in the numerous sclerotia formed in the mummy fruits. The fungus is described as a new species, with the name *Fusarium erubescens*, and it is critically compared with several other species of Fusarium.

Experiments have shown that weak solutions of Bordeaux mixture have little effect in checking the growth of the fungus. Therefore it is suggested that tomatoes should be sprayed with strong solutions of Bordeaux mixture as soon as the disease makes its appearance.

Bacterial disease of tomatoes (*Bd. Agr. and Fisheries* [*London*], *Leaflet 152, pp. 2, fig. 1*).—A description is given of a bacterial disease of tomatoes that has been

known as occurring in France for a considerable time, where it has assumed the proportions of a destructive epidemic. It has been recently reported in several widely separated localities in England, on which account attention is drawn to it.

The symptoms of the disease are said to be very marked and can not be confounded with those of any other tomato disease at present known. When the tomato is about the size of a marble a minute black patch appears at the base of the style. This patch gradually increases in size, retaining a circular outline, until eventually the entire fruit is reduced to a blackish, soft, decayed mass.

Experiments have shown that infection takes place during the flowering stage and that the bacteria causing the disease are deposited on the stigma by flies visiting the flowers.

The stigma seems to be the only vulnerable part under ordinary conditions, but if bacteria from a diseased fruit are introduced into the flesh of a healthy tomato, infection follows.

The disease does not appear to be influenced to any extent by the forcing methods commonly followed, as it has been observed in houses where the temperature was kept comparatively low.

When the disease appears all diseased fruit should be removed as quickly as possible, and insects should be excluded by using insecticides. Where this is done, artificial pollination will be necessary.

The blight canker of apple trees, H. H. Whetzel (*New York Cornell Sta. Bul. 236, pp. 101–138, figs. 36*).—A description is given of a form of apple-tree canker which is due to the same cause as that which produces the bacterial or fire blight of the pear. It seems to be favored by rapid growth of the trees, and the points of inoculation are water sprouts, wounds, and possibly the flowers. After reviewing the different kinds of cankers that have been described as occurring on apple trees, the author gives the distinguising characters and appearance of the canker treated in this bulletin, which is due to *Bacillus amylovorus*.

These cankers occur most frequently on the bodies and limbs of young trees, and the diseased areas are sunken and smooth, covered with a brown surface, but not showing any pimples or fungus fruit bodies, which characterize some of the other forms of fruit-tree canker. The effect of the disease on the tree is to lower its vitality by cutting off the food supply to the roots and indirectly reducing the flow of sap to the branches and leaves.

Inoculation experiments have shown that the disease can be readily caused through wounds. As preventive measures the author recommends the burning of all dead limbs and trees as promptly as possible and cutting out and burning every trace of twig blight on both apple and pear trees as soon as detected. When pruning, all cut surfaces should be treated with corrosive sublimate or copper sulphate solution. Water sprouts should be cleaned from the trees, and the excessive use of nitrogenous fertilizers should be avoided. When possible the planting of varieties known to be resistant to the disease is recommended. Wolf River and Talman Sweet appear to be quite resistant, while Baldwin and Ben Davis suffer severely. In order to prevent the spread of the disease the author suggests an early spring treatment with lime-sulphur wash.

Notes are given on the distribution and severity of the disease throughout New York, and a detailed account is given of the identity of the organism, and notes on its morphology, cultural relation, etc. A bibliography of the publications relating to this disease completes the bulletin.

A fungus disease of the mandarin orange, P. A. Saccardo (*Separate from Ann. Mycol., pp. 3; abs. in Ztschr. Pflanzenkrank., 15 (1905), No. 3, p. 175*).—The author states that mandarin oranges were noticed in Naples that showed dark spots on the rind, the spots later becoming confluent.

Upon examination the rind was found matted with mycelium which when old became of a dark violet color. When placed in a moist chamber there soon developed on the rind violet black hyphæ and conidiophores that characterize *Alternaria tenuis*, but the fungus differed in some respects from this species. The author has described it as a form of the above species, naming it *A. tenuis chalaroides*.

A disease of bananas in Central America, H. Pittier de Fabrega (*Jour. Agr. Trop., 5 (1905), No. 54, pp. 379, 380*).—A brief account is given of a disease of bananas, the origin of which is in doubt, but which has caused the destruction of hundreds of hectares of plants in Costa Rica and Panama. The author holds that the disease is due to faulty drainage, the soil having been saturated by heavy rains and lacking cultivation.

The American gooseberry mildew, J. Eriksson (*K. Landthr. Akad. Handl. och Tidskr., 44 (1905), No. 4-5, pp. 273-288*).—The author describes *Sphærotheca mors-uva*, which is said to have first appeared in Sweden in 1902 and in Ireland in 1900, in Russia in 1901, and in Denmark in 1904.

An account is given of the distribution of the fungus in the United States, its life history, and methods of combating it. Among the protective measures recommended are the planting of healthy stocks, early destruction of badly affected bushes, and spraying the bushes and ground with potassium sulphid (30 gm. to 10 liters of water). When bushes are only slightly affected the diseased parts should be cut off and burned in the fall and the bushes sprayed early in the spring before the leaf buds appear. The spraying should be repeated every 8 to 14 days until the berries have attained about half their mature size.—F. W. Woll.

Black blight in Granada, R. D. Anstead (*Agr. News [Barbados], 4 (1905), No. 96, p. 394*).—In a report to the Agricultural Committee of Granada, the author deals with the nature and control of the black blight that is prevalent in that island, attacking mango, bread fruit, sapodilla, guava, and rose apple trees. The blight is due to a species of Capnodium, which follows the presence of a number of scale insects.

For the prevention of the disease the author recommends cultivation of the plants, clean culture, and the use of insecticides against the scale insects.

Gray blight of tea, T. Petch (*Trop. Agr. and Mag. Ceylon Agr. Soc., 25 (1905), No. 5, pp. 630, 631*).—The author gives a note on the gray blight of tea, which is attributed to the fungus *Pestalozzia guepini*, and calls attention to the fact that spores indistinguishable from those producing the gray blight are formed on rose leaves attacked by *Actinonema rosæ* when kept in a moist chamber for some days. This form has been called *P. suffocata*, but the author believes the differences are so slight as to indicate the possible identity of this species with the one above.

The gray patches on tea leaves are said to be well known, but in some cases the fungus attacks the leaf stalk at the junction of the stem, in which case the leaf turns brown, falling from the bush before producing any indications of the disease on the leaf. The stem of the bush may also be attacked, the fungus entering the young shoot at the cut end left in gathering the tea, in which case the young shoot is killed to the base. It also occurs on stems an inch or more in diameter, forming a kind of canker. A similar fungus is said to attack *Hevea brasiliensis*, causing slight damage to the leaves, but the plants in a short time recover from the attack.

The bud rot of the cocoanut palm (*West Indian Bul., 6 (1905), No. 3, pp. 307-321; noted in Agr. News [Barbados], 4 (1905), No. 95, pp. 369, 370*).—Mention has already been made of the occurrence in various parts of the West Indies of a serious disease of cocoanut palm known as the bud rot. This has recently become prominent in Trinidad, where one plantation reports the loss of 2,000 trees in 6 months.

The cause of the disease has been attributed to the fungus *Pestalozzia palmarum*, but recent investigations (E. S. R., 17, p. 158) seem to indicate that bacteria play an important part.

It is said that probably no remedial measures will be found effective in the case of palms already seriously attacked, but to prevent the further spread of the disease all affected palms should be cut down and burned or buried with lime. Experiments in Jamaica have shown that spraying with Bordeaux mixture on the first indication of the disease is somewhat effectual. As the disease is of a virulent character, energetic efforts are recommended to stamp it out.

A green-skinned variety of cocoanut in Jamaica is said to be less liable to bud rot than the yellowish and reddish varieties commonly grown, and if this should be confirmed it may be possible to establish a race of cocoanuts resistant to disease.

Cacao disease in Ceylon (*Trop. Agr. and Mag. Ceylon Agr. Soc., 25 (1905), No. 2, pp. 293–296*).—The cacao trees in Ceylon are subject to a serious disease, which finds favorable conditions for its spread in dense shade and abundance of moisture commonly found on cacao plantations.

The disease, which is of fungus origin, attacks both fruit and stems. The pods become dark brown or black, and unless controlled the disease spreads rapidly. The disease can be restrained by collecting and destroying the diseased pods at frequent intervals, or by spraying with Bordeaux mixture. In addition the shade should be removed to some extent and the diseased tissues of the stems collected and burned.

In 1902, 96 per cent of the trees and 14 to 62 per cent of the pods of a plantation were attacked by the fungus. The preventive measures described above were begun in 1902 and within 6 months an improvement was noted. In 1904 less than 4 per cent of the fruit was attacked and the yield increased from 0.83 cwt. per acre in 1902 to over 2 cwt. in 1904.

Canker of rubber, T. Petch (*Trop. Agr. and Mag. Ceylon Agr. Soc., 25 (1905), No. 2, p. 298*).—In a report on the canker of *Hevea brasiliensis* mention is made of the fact that a large portion of the fruit did not ripen and split in the normal way, but remained on the tree and blackened or fell off without splitting.

An examination showed that this condition is due to a parasitic fungus similar to, if not identical with, that which causes the decay of cacao pods, which is generally attributed to *Phytophthora omnivora* and *Colletotrichum incarnatum*, the first of which is the more destructive. The Hevea fruits examined were all attacked by a species of Phytophthora which permeates the soft outer tissues of the fruits, causing the seeds to dry up. All diseased fruit should be collected and burned as a precautionary measure.

A disease of Hevea seedlings, T. Petch (*Trop. Agr. and Mag. Ceylon Agr. Soc., 24 (1905), No. 12, p. 138*).—A report is given of leaves of Hevea seedlings being attacked by a species of Helminthosporium.

The leaves were studded with circular, semi-transparent spots, each surrounded by a brown layer. It is thought probable that the spots are due to insect punctures and that the fungus gains access to the tissues through these injuries. As a consequence of this discovery a number of nurseries of this species of rubber were examined without discovering much disease, but there were found commonly present injuries that seemed to be due to fungi, the most common of which was *Periconia pycnospora*. It is believed that the fungi were present as a result of mechanical injury, which in many instances is attributed to the burning of the leaves by light shining through globules of water collected on the foliage.

The destruction of Siberian firs in Adlisberg, H. C. Schellenberg (*Mitt. Schweiz. Centralanst. Forstl. Versuchsw., 8 (1905), No. 3, pp. 269–286, pl. 1*).—In 1901 the author examined a plantation of Siberian firs that was about 30 years old and found many of the trees suffering from the attacks of some fungus. Upon closer investigation the bark was found thickly studded with the small orange-yellow fruiting bodies of *Dasyscypha calyciformis*, and where these bodies were abundant the

bark was dead and of a reddish color. The trees in general appeared unhealthy and many were dead.

Subsequently studies were made of the fungus, and comparisons are drawn between this and allied species. The development and life history of the parasite are described, after which notes are given on inoculation experiments carried on in the forest, the amount of injury caused, etc.

Root rot of logwood trees (*Agr. News [Barbados], 4 (1905), No. 96, p. 389*).—This disease, which was previously described (E. S. R., 14, p. 882), causes the destruction of trees in considerable number through the presence of a mycelium invading the roots and spreading upward into the trunk, between the bark and the wood. Although the fruiting organs of the fungus have not been discovered, it is believed to be a hymenomycete.

The disease is found in trees growing in different kinds of soils and under varying climatic conditions, and has been recently reported as spreading rapidly in Jamaica. It is contagious, spreading through the soil, and to prevent its further spread it is recommended that trenches 3 ft. deep be dug about the diseased area, when confined to definite patches. Where it is widely disseminated the clearing of the infested tract and cultivation with other crops are recommended.

Some Indian forest fungi, E. J. Butler (*Indian Forester, 31 (1905), No. 10, pp. 548–556, figs. 3*).—After discussing fungus diseases in general, the author describes the attacks of *Chrysomyxa himalense* on rhododendrons and different forms of *Gymnosporangium cunninghamianum*, the æcidial form of which occurs on *Pyrus pashia* and the teleuto form on cypress.

Some rose diseases, E. Foex (*Prog. Agr. et Vit. (Ed. l'Est), 26 (1905), No. 48, pp. 616–619, pl. 1*).—The author describes the rose rust, due to *Phragmidium subcorticium*, the rose mildew (*Sphærotheca pannosa*), and the attacks of *Marsonia rosæ*, which causes the premature falling of the leaves.

For the control of the mildew the author recommends spraying with a mixture of carbonate of soda 1.5 kg., Norwegian tar 0.5 kg., and water 100 kg.

North American salvia rusts, E. W. D. Holway (*Jour. Mycol., 11 (1905), No. 78, pp. 156–158*).—Technical descriptions are given of a number of species of rusts that are known to attack various species of salvia, and *Puccinia infrequens*, *P. badia*, and *P. nivea* are described as new species.

A new orchid disease, G. Massee (*Gard. Chron., 3. ser., 38 (1905), No. 973, pp. 153, 154, fig. 1*).—A description is given of a recently recognized disease of Oncidium, which is attributed to *Hemileia americana* n. sp.

This fungus, which is closely allied to that causing the most destructive coffee disease, threatens to become a serious pest in orchid culture if it once becomes established. The fungus forms bright orange, powdery-looking patches of various sizes on the under surface of the leaf, with corresponding areas of a sickly yellowish-green color on the upper surface. On account of the threatened seriousness of this disease, the prompt destruction of every leaf showing the symptoms above indicated is recommended.

An orchid disease, H. Klitzing (*Gard. Chron., 3. ser., 38 (1905), No. 980, p. 259*).—A description is given of *Gloeosporium beyrodtii*, a new species which appears in dense masses on both sides of the leaves of *Vanda cærulea*. The spots sometimes run together, forming dark blotches, and finally bring about the destruction of the entire plant. The fungus is briefly characterized.

The action of copper salts on plants, F. Porchet and E. Chuard (*Bul. Murith. Soc. Valais. Sci. Nat., 1904, No. 33, pp. 204–210, pl. 1*).—This bulletin, which was issued in 1905, gives an account of experiments which have been carried on at the Viticultural Station of Lausanne since 1886 to test the effect of copper compounds on plants, especially the practical effect in reducing disease, and the effect of fungicides on wines made from sprayed grapes.

The physiological effect of fungicides on the plants themselves, particularly with reference to fruit maturing, has also been determined. The investigations showed that treating vines with copper solutions resulted in a stimulation of growth, through the absorption of minute traces of copper, and the ripening period of the grapes was also accelerated.

To determine the penetration of copper into plant tissues an experiment was inaugurated in the spring of 1903 in which different lots of grape cuttings were potted in a peaty leaf mold and the different pots given varying amounts of copper, iron, magnesium, and cadmium salts in solution, the concentrations varying from 0.001 to 1 per cent. In 10 days the lots receiving the weaker solutions of copper began to force their buds. Eleven days later those which had received magnesium sulphate had 4 leaves, and the buds on the cuttings receiving 0.01 and 0.001 per cent copper sulphate were bursting. All others showed no growth.

At the end of 33 days all buds had burst except those receiving iron sulphate, and these were more than 2 months in developing. In the autumn it was observed that the leaves remained on the treated vines long after the check lots had lost their leaves, and the cuttings treated with magnesium sulphate and iron sulphate lost their leaves before those which received the copper sulphate solution. These retained their foliage late into the fall, ultimately losing them in direct proportion to the strength of solution with which they had been treated.

The quantity of copper in the different lots was determined late in the autumn, and it ranged from 0.0133 gram of copper per 100 gm. of dry weight for the lot receiving a 1 per cent solution to a trace in the lot receiving 0.01 per cent, and not even a trace where the more dilute solutions were used.

Recognizing the corrosive action of copper sulphate on the delicate roots formed from cuttings, this feature was investigated, and it was found that the humus in the pots had acted on the copper, causing it to lose its toxic effect upon the root tissues.

The adulteration of copper sulphate (*Jour. Bd. Agr.* [*London*], *12* (*1905*), *No. 9, pp. 542, 543*).—On account of the extensive use of copper sulphate as a fungicide and the corrosive effect of some impurities, the writer suggests that in purchasing this material demand should be made for a product of 98 per cent purity. This is practically a pure copper sulphate and is without the corrosive effect that is observed in some of the adulterated specimens.

The results of the analysis of an adulterated sample show that it contained 17.6 per cent crystallized copper sulphate and 82.4 per cent crystallized iron sulphate. As an easy test for the presence of iron in copper sulphate the writer suggests dissolving a little in water and adding ammonia with constant stirring until a liquid of a deep blue color is formed. If iron is present in any quantity it will be shown by the occurrence of brown flocculent masses floating in the blue liquid.

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Agricultural zoology, G. Guénaux (*Zoologie Agricole. Paris: J. B. Baillière & Sons, 1905, pp. XII + 563, figs. 168*).—The present volume includes a general discussion of the importance from an agricultural standpoint and the use of farm animals, together with an account of the habits and economic relations of birds, reptiles, amphibians, and small mammals. Particular attention is given to the feeding habits of the various species discussed.

Protection of birds which are beneficial to agriculture (*Jour. Agr. Prat., n. ser., 10* (*1905*), *No. 52, pp. 816–818*).—An international convention was held in Paris on December 6, 1905, at which time various European countries were represented, including France, Germany, Austria-Hungary, Belgium, Spain, Greece, Sweden, Switzerland, etc. The purpose of this convention was to adopt a uniform method of procedure regarding the protection of beneficial birds.

At this convention 16 articles or resolutions were adopted and some of the more important points mentioned in these resolutions may be briefly stated in this connection. Insectivorous birds, of which a list is given and to which additions may be made as more knowledge is gained concerning the feeding habits of these birds, are recommended for absolute protection as well as their nests and eggs. More stringent legislation is recommended for preventing the destruction of nests and eggs and the use of traps, cages, nets, and other devices for capturing birds. The proprietors of vineyards or gardens are to be granted the privilege of destroying birds in case they should become injurious on the premises in question. A list is also given of injurious birds.

Special report on the decrease of certain birds and its causes with suggestions for bird protection, E. H. Forbush (*Agr. of Mass., 52 (1904), pp. 429–543, pls. 2*).—An elaborate historical account is given of the former prevalence of birds in Massachusetts and neighboring States and the decrease in numbers of these birds due to various causes.

Among the agencies which may affect the destruction of birds the author enumerates the unfavorable weather of 1903–4, the destruction of birds by sportsmen, bird shooters and trappers, market hunters, boy gunners, and egg collectors. Apparently six species of game birds and water fowl have disappeared in Massachusetts within historical times and shore birds are estimated to have decreased in numbers to the extent of 75 per cent. Swallows, night hawks, eagles, great blue herons, house wren, red-headed woodpecker, and various other species of similar birds are on the decrease.

Notes are given on the natural enemies of birds, especially cats and English sparrows. In order to protect birds from further unnecessary depredations it is suggested that more attention be given in the schools to the economic value of birds and the desirability of protecting them.

Animal and insect pests, E. Wright (*Queensland Agr. Jour., 16 (1905), No. 1, pp. 67–70*).—The flying fox is considered as one of the most important fruit pests along the eastern coast of Queensland. Notes are also given on certain birds which are injurious to fruits as well as on the fruit fly and other insect pests.

Entomology with special reference to its biological and economic aspects, J. W. Folsom (*Philadelphia: P. Blakiston's Son & Co., 1906, pp. VII + 485, pls. 5, figs. 300*).—According to the author this volume is intended for the student and general reader, and was written to cover as fully as possible within the limits of the book the biological aspects of insects.

The subject-matter is arranged under the heads, classification; anatomy and physiology; development; adaptations of aquatic insects; color and adaptive coloration; origin of adaptations; insects in relation to plants, animals, and man; insect behavior; and distribution. A classified bibliography of important entomological literature is also presented (pp. 409–466). The literature of economic entomology is discussed. One of the most valuable features of the book is the discussion of the economic relations of insects.

Catalogue of publications relating to entomology in the library of the U. S. Department of Agriculture (*U. S. Dept. Agr., Library Bul. 55, pp. 562*).—This bulletin contains a classified list of 5,600 publications relating to entomology in the library of the Department. The titles are grouped under general entomology, economic entomology, faunas, and various orders of insects, Myriapods, and Arachnida. A list of serial publications relating to entomology is also given and the bulletin is provided with an index to insect families and authors.

Insects of the year, W. Stuart (*Vermont Sta. Rpt. 1905, pp. 309–314, figs. 2*).—No serious outbreaks of injurious insects occurred during the season, but the usual number of requests were made concerning insect injuries of lesser importance.

Among the injurious species of which brief notes are given are woolly aphis, red-humped apple-worm, oyster-shell bark-louse, and apple-leaf miner.

The periodical cicada in 1906, C. L. Marlatt (*U. S. Dept. Agr., Bur. Ent. Circ. 74, pp. 5, figs. 3*).—During the present season two broods of the periodical cicada will reappear, one being a 17-year brood and distributed from Illinois to Massachusetts and southward to Georgia. The other is the 13-year brood and is distributed in North Carolina, Georgia, Alabama, and Tennessee. Brief notes are given on the damage done by this pest. The broods are expected to appear about the last week in May.

Studies in grasshopper control, J. S. Hunter (*California Sta. Bul. 170, pp. 23, figs. 17*).—During 1904, grasshoppers were very injurious in the San Joaquin Valley, where they hatched out in April or earlier and appeared in large numbers early in May. Various crops are raised on the infested ground, but in one locality the grasshoppers were found very injurious in an area of about 2,000 acres devoted to alfalfa. The species concerned in this outbreak are *Clinopleura melanopleura*, *Melanoplus uniformis*, *M. devastator*, and *Œdaleonotus enigma*.

In combating grasshoppers it was found possible to destroy the young insects by burning the grass where the ground was fairly well covered. The winged form were also destroyed by the same means if the work was done during cool nights. Considerable success was had in poisoning grasshoppers, not by the Criddle mixture, which was unsatisfactory, but by the use of a poison bait which contained 5 lbs. of arsenic in 40 lbs. of bran moistened with 2 gal. of molasses. Hopperdozers could not be used as effectively in orchards as in alfalfa fields. Occasionally good results could be obtained by smoking the grasshoppers out of the fields. Near Newman the injurious species was *Melanoplus differentialis*. This pest defoliated vineyards and orchard trees, eating the fruit.

The Hessian fly, F. M. Webster (*U. S. Dept. Agr., Bur. Ent. Circ. 70, pp. 16, figs. 16*).—A general account is presented of this important insect of wheat with notes on its early history, appearance, stages, habits, distribution, food plants, and injuries.

There appears to be no variety of fly-proof wheat, although macaroni wheat is somewhat less injured than other kinds. The natural enemies of the pest are discussed, and notes are given on the various remedies which have been tried for this insect, late sowing, crop rotation, burning of stubble, destruction of volunteer wheat, use of fertilizers, preparation of the soil, and use of good seed. In preventing the attacks of the Hessian fly the author recommends that good seed should be sown in well-prepared soil after the larger part of the fall brood has made its appearance. In spring seeding it is believed that the earlier wheat is sown the less danger there will be from the Hessian fly.

Some insects affecting the production of red clover seed, F. M. Webster (*U. S. Dept. Agr., Bur. Ent. Circ. 69, pp. 9, figs. 8*).—Particular attention is given in this circular to the clover-flower midge and clover-seed chalcis.

It is believed that the clover-flower midge does not really infest the seed but lays its eggs in the ovaries before fertilization has taken place. The clover-seed chalcis, however, lives in the seeds only. No insects like bumblebees are able to fertilize clover which has been infested with the clover-flower midge. This insect is described in all its stages and notes are given on its life history. It has been reported as quite common in England and occurs in this country wherever clover is grown.

The best methods of controlling it consist in cutting clover not later than the second week in June in fields where clover is grown without much admixture of timothy. This operation seems to destroy the larvæ of the midge and also to hasten the second blooming so that the flowers are too far advanced for infestation by the midge. In cases where clover and timothy are grown mixed, the same results may be obtained by pasturing clover in the spring so as to delay the flowering period.

The clover-seed chalcis is also described and notes are given on its life history. This pest attacks the seed of red and crimson clover and also alfalfa. It is distributed also from New England to California on the west, and south to Mississippi. Insect enemies capable of controlling the pest are not known. Remedies recommended for the clover-flower midge might apply to this insect, and it is also suggested to destroy scattering heads of clover together with the chaff and stems after hulling.

The clover root borer, F. M. WEBSTER (*U. S. Dept. Agr., Bur. Ent. Circ. 67, pp. 5, figs. 4*).—This insect is a native of Europe and has become generally established in the eastern States. It attracted attention in 1878 in New York and has gradually spread toward the Mississippi River.

The insect is described in its various stages and notes are given on its life history and food plants. There appears to be but one annual generation. It feeds on red clover and alfalfa as well as other species of clover. Infested clover plants sooner or later die as a result of the attack of this insect. Apparently the only successful way of combating the pest is summer fallowing as soon as the hay crop is removed.

The tobacco thrips and remedies to prevent "white veins" in wrapper tobacco, W. A. HOOKER (*U. S. Dept. Agr., Bur. Ent. Circ. 68, pp. 5, figs. 2*).—*Euthrips nicotianæ* was described in September, 1905. The insect injures shade-grown cigar-wrapper tobacco in Florida, Georgia, and Texas.

The removal of the sap from the lateral veins of the leaves causes white streaks when the leaves are cured. This is objectionable from the standpoint of the cigar maker and reduces their value about 50 per cent. The adult insect appears to pass the winter in the tobacco fields. They deposit their eggs in the tissues of the stem and leaves and the young larvæ feed on the under surface of the leaves and the adults feed upon the upper surface. In combating this species clean cultivation is recommended. The pest appears in oats and it is urged that this crop be not planted in the vicinity of tobacco fields.

As an insecticide application the author recommends the use of kerosene emulsion according to the formula 2 gal. of kerosene, 1 gal. of water, and ½ lb. of hard soap diluted to make 10 gal. A number of applications should be made while the plants are in the seed bed and later in the field about two applications a week may be required. The expense of such an application does not exceed $20 per acre.

Pea and bean beetles (*Bd. Agr. and Fisheries [London], Leaflet 150, pp. 4, figs. 2*).—Descriptive, economic, and biological notes are given on *Bruchus pisi* and *B. rufimanus*.

The turnip mud-beetle, R. S. MACDOUGALL (*Jour. Bd. Agr. [London], 12 (1905), No. 2, pp. 102–104, fig. 1*).—*Helophorus rugosus* is quite widely distributed throughout England and Scotland. It attacks turnips by eating the leaves and tunneling the leaf stalks and roots. The injury is done both by the beetle and larvæ. Rotation of crops is recommended in controlling this pest, together with the liberal use of fertilizers.

The use of bisulphid of carbon against wireworms (*Jour. Bd. Agr. [London], 12 (1905), No. 2, pp. 104, 105*).—It has been found that the character of the soil largely determines the rate at which the fumes of this gas diffuse from the point where it was injected into the soil. In using bisulphid of carbon against wireworms little benefit can be expected on very wet soils, and the application should be made before the damage from the wireworms is too far advanced, and moreover the bisulphid of carbon should not be allowed to come in contact with the roots of the plants.

Report of the State nursery inspector, H. T. FERNALD (*Agr. of Mass., 52 (1904), pp. 243–247*).—Of the pests which require the attention of the inspector in Massachusetts, San José scale, oyster-shell scale, gypsy moth, and brown-tail moth are the most important. Brief notes are also given on black knot and other fungus diseases.

Report on work done in 1903–4 in the control of San José scale and other dangerous insect and fungus pests (*West Virginia Sta., 1904, pp. 96, figs. 16*).—An account of nursery inspection during the year under report is given by W. E. Rumsey (pp. 7–15).

A tabulated list of West Virginia nurseries is presented, with notes on their condition. The work along the line of orchard inspection is discussed by W. E. Rumsey and T. E. Brooks. This account includes a statement regarding the distribution of San José scale in country districts and in towns, spray mixtures for use in controlling this insect, and a brief résumé of the principal fruit sections of the State. The report also contains an account of spraying melons in the Ohio River Valley, by F. E. Brooks, and plant diseases of the State, by J. L. Sheldon.

Report on work done in 1904-5 in the control of San José scale and other dangerous insect and fungus pests (*West Virginia Sta. [1905], pp. 60, pls. 7*).—In the report for this year considerable attention is given to the grape curculio, which is discussed by F. E. Brooks. The same author also discusses nut weevils in West Virginia.

The report also contains a special report of the bacteriologist, J. L. Sheldon, on various plant diseases; potato blight, by A. L. Post; other investigations on potatoes, by T. C. Johnson; and a study of combined insecticides and fungicides, by B. H. Hite and C. H. Howard. Brief notes are also given as usual in these reports on nursery and orchard inspection.

Some points in nursery inspection, E. A. Popenoe (*Industrialist, 32 (1906), No. 18, pp. 275–279*).—The San José scale was the chief cause of the present nursery inspection laws in Kansas. A brief account is given of the methods employed in inspecting the nurseries, with particular reference to the more serious insect and fungus diseases. It is believed that not all of these diseases are transmitted in nursery stock. Apple-tree borers are apparently seldom carried in young nursery stock.

The plum curculio, F. Johnson and A. A. Girault (*U. S. Dept. Agr., Bur. Ent. Circ. 73, pp. 10, figs. 5*).—The life history and habits of this pest are described in detail.

The insect attacks plums, cherries, peaches, nectarines, apricots, apples, and pears, and sometimes feeds upon the foliage after the fruit has been harvested. The method of the attack upon various fruits is described and notes are given on the natural enemies of the pest. One of the most extensively applied remedies for the insects consists in the use of some form of jarring trap. This method has been widely adopted in plum and peach orchards in the South and has proved very satisfactory. The pest may be destroyed by thorough spraying with arsenicals. For this purpose arsenate of lead may be used at the rate of 2 lbs. to 50 gal. of water, or Paris green at the rate of 1 lb. to 150 to 200 gal. of water.

The codling moth in Arizona, J. J. Thornber (*Arizona Sta. Rpt. 1905, p. 22*).—The codling moth has been known in Arizona for 2 years and in infested districts causes wormy apples to the extent of 30 to 40 per cent. No hope is held out that this insect may be eradicated in Arizona, but it is believed that its presence will have an indirect benefit in forcing orchardists to spray their trees more thoroughly.

Report of committee on gypsy moth, insects, and birds, A. Pratt et al. (*Agr. of Mass., 52 (1904), pp. 217–239*).—A brief review is presented of the condition of the infested region contrasting the conditions observed in 1899 and 1904 in various towns in the neighborhood of Boston. A few new colonies have appeared outside the area which was known to be infested in 1899. In general the insect has spread slowly in various directions and in the localities of long infestation the numbers of the pests have greatly increased.

The brown-tail moth in Maine, E. F. HITCHINGS (*Bul. Maine Dept. Agr.*, (*1905*), *No. 4, pp. 101–127, pls. 4*).—A copy is presented of considerable correspondence relating to the prevalence of the brown-tail moth in Maine.

The Pomological Society of the State succeeded in getting an appropriation of $5,000 for 1905 and 1906 for the purpose of combating the brown-tail moth. In accordance with the act passed by the legislature a State entomologist was appointed to devote his time to the suppression of this and other insect and fungus pests. A review is given of the present status of the brown-tail moth in Maine. In many localities rewards have been offered for the destruction of the nests of this insect and data regarding the amounts of money thus expended are presented in a tabular form.

The life history of the brown-tail moth is described and notes are given on other insect pests, including apple aphis, woolly aphis, scurfy bark-louse, and strawberry weevil, as well as on nursery inspection.

The goat moth and the wood leopard moth, R. S. MACDOUGALL (*Jour. Bd. Agr. [London], 12 (1905), No. 2, pp 115–118, fig. 1*).—Notes are given on the habits and life history of *Cossus ligniperda* and *Zeuzera æsculi*. Small branches infested with the leopard moth should be removed and burned, and the same remedies should be applied to trees infested with goat moth. The goat moth may be prevented to some extent from laying its eggs by painting the lower part of the tree with soft soap, kerosene, or some other substance obnoxious to the insect.

Woolly aphis, T. W. KIRK (*New Zeal. Dept. Agr. Ann. Rpt., 13 (1905), pp. 407–409, figs. 4*).—This pest is difficult to control on the more susceptible varieties of apples. A list is presented of apple varieties which appear to be more or less resistant to woolly aphis. The aerial form of the pest may be controlled by the use of kerosene emulsion or by fumigation with hydrocyanic-acid gas.

Leaf hoppers and their natural enemies, R. C. L. PERKINS and G. W. KIRKALDY (*Hawaiian Sugar Planters' Sta., Div. Ent. Bul. 1, pts. 9, pp. 267–479, pls. 12; 10, pp. 483–499, pls. 6; introduction, pp. XXXII+501–508, figs. 7*).—In continuation of this series (E. S. R., 17, p. 783) the general anatomical characters of leaf hoppers are described by G. W. Kirkaldy, in part 9, with notes on the rapidity of their multiplication, other points in their life history, and their classification. In the study of this group in the Hawaiian Islands and elsewhere various new species have been discovered and of many of these descriptions are given. Notes are also presented on the relations between leaf hoppers and ants. A bibliography of literature relating to leaf hoppers is appended to the bulletin.

Part 10 is supplementary to part 1 (E. S. R., 17, p. 477), and deals with observations made in Australia and Fiji Islands and material collected in those countries. A number of new species of Drymidæ and Pipunculidæ are described

In the introduction by R. C. L. Perkins, which is the last part received, a general account is presented of the work done in Australia, Fiji Islands, and the United States, with particular reference to the methods of transporting and handling parasites and also to the effects of these parasites upon the leaf hoppers. A brief summary of the bulletin is added, together with an index.

The pepper weevil, A. MERAZ (*Com. Par. Agr. [Mexico], Circ. 33, pp. 4, fig. 1*).—Peppers are subject to the attacks of *Anthonomus eugenii*. This pest was studied by the author, with particular reference to practical methods for controlling it.

It is recommended that peppers should not be planted on soil cultivated to Indian corn during the previous year. The selection of seeds from fruits which have resisted the attack of the insect is desirable on account of the fact that they possibly possess some resisting power. Infested fruits should be collected and destroyed as soon as they are recognized. Rotation of crops is also recommended. Some benefit may be derived on spraying with arsenicals, especially arsenate of lead.

The habits, life history, and means of combating Agrostis segetum, K. Rossikov (*Trudui Byuro Ent. [St. Petersb.], 6 (1905), No. 5, pp. 120, pls. 4, figs. 37*).—An elaborate review is presented of the appearance, distribution, and life history of this cutworm. The author discusses the number of generations, the egg, larva, and other stages of the pest. Attention is given also to its insect parasites belonging to various orders, with reference also to fungus and bacterial diseases. In the discussion of methods for controlling the pest the subject is discussed under different heads, according to the stage of the insect concerned.

The larva of Plodia interpunctella, B. Wahl (*Ztschr. Landw. Versuchsw. Oesterr., 8 (1905), No. 10, pp. 950–954*).—This pest was found in fig coffee and also in a number of other food products. The systematic position of the moth is briefly outlined, and detailed notes are given on the external anatomy of the caterpillar, with particular reference to the number and location of the bristles.

Parthenogenesis in Otiorrhynchus turca, A. A. Ssilantjew (*Zool. Anz., 29 (1905), No. 18, pp. 583–586, figs. 2*).—In studying this insect which has recently caused great damage to grapes in the region of the Black Sea, the author observed that no males were to be found. Observations along this line showed that females taken immediately after emergence and kept confined in glass jars during their whole life laid eggs which were perfectly fertile and developed into normal individuals.

On the Cecidomyid forming the galls or pseudocones on Pinus longifolia, E. P. Stebbing (*Indian Forester, 31 (1905), No. 8, pp. 429–434, pl. 1*).—For some time galls have been noticed on this pine tree which so closely resembled the cones as to be mistaken for them. When examined by the author they were found to be due to a species of Cecidomyia, which is briefly described. Notes are also given on a parasitic insect found upon the gall insect.

A new enemy of the Douglas fir, R. S. Macdougall (*Jour. Bd. Agr. [London], 12 (1906), No. 10, pp. 615–621, figs. 4*).—*Megastigmus spermotrophus* was found infesting the seeds of Douglas fir.

This insect is described in its various stages. The eggs are laid in the young cones of the Douglas fir and each seed is infested by one larva. In preventing the destruction of cones by this pest it is recommended that after the seed is collected it should be subjected to treatment of bisulphid of carbon at the rate of 1 oz. for every 50 cu. ft. of air space.

Notes on termites with special reference to the destruction of timber by Calotermes brouni, T. Broun (*New Zeal. Dept. Agr. Ann. Rpt., 13 (1905), pp. 430–436, pls. 2*).—It has been found that for railroad ties various woods may safely be used which would otherwise soon be destroyed by white ants. This is due to the fact that the ants are frightened away by the jar produced by passing trains.

Calotermes brouni is an exceedingly injurious species, and notes are given on its injury to various kinds of wood, especially Puriri and Kauri woods. The insect is described in its various stages.

Spraying apples. Relative merits of liquid and dust applications, C. S. Crandall (*Illinois Sta. Bul. 106, pp. 205–242, figs. 14*).—While a combination of Bordeaux mixture and arsenicals has long been known to give satisfactory results in the control of scab and some of the other common fungus diseases of apples, as well as codling moth and leaf-eating caterpillars, the method is somewhat extensive and various experiments have been made to test the economy of dust sprays.

The author's work along this line has been carried on for a period of 3 years, during which various plats of apple trees were sprayed or dusted from 3 to 8 times during the season, the first application being made just as the buds were opening. Particular attention was given during this series of experiments to the effect of treatment on apple scab, fruit blotch, codling moth, and curculio. It appears from these experiments that the pests just mentioned must be recognized as of a permanent nature and

that they require annual treatment in order to secure a good crop of clean fruit. The use of a dust spray considerably diminishes the cost and labor of spraying, but it is quite inefficient.

Trees sprayed with liquid Bordeaux mixture and Paris green retained their foliage through the season, while the foliage turned yellow and fell off from the trees treated with a dust mixture as readily as from the check trees. This loss of foliage is an important matter in the growth of the tree and indicates clearly that the dust method is not satisfactory. The dust spray is 52 per cent cheaper than the liquid spray but, according to the author, has no other advantages. It is, therefore, recommended that the orchardist spend his time and energy in perfecting his methods of preparation and application of Bordeaux mixtures combined with arsenicals.

In these experiments the formula used for the liquid Bordeaux mixture was 4 lbs. copper sulphate, 4 lbs. of lime, ¼ lb. Paris green per 50 gal. of water, and a proprietary form of Bordeaux and Paris green was used for the purpose of comparison.

Spraying, G. F. Warren (*New Jersey Stas. Bul. 194, pp. 60*).—The purpose of the author was to combine in the present bulletin in a convenient form the various recommendations which have been made by the station in previous publications regarding the control of insects and fungus diseases. The bulletin constitutes a convenient summary of information on this subject and contains an account of the purpose of spraying, the methods to be adopted in spraying various fruit and garden crops, a spray calendar, formulas for the preparation of the more important fungicides and insecticides, and a discussion of spray pumps.

Spray calendar (*Vermont Sta. Spec. Bul., Apr., 1906, folio*).—Formulas are given for the preparation of lime-sulphur-salt wash, Paris green, Bordeaux mixture, Hellebore, and kerosene emulsion, and brief directions are given for the application of these remedies.

The preparation of emulsions of crude petroleum, T. M. Price (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 89, pp. 4*).—The ordinary kerosene emulsion is not well adapted for use as a dip or hand treatment for animals, since the oil does not remain emulsified and is distributed unevenly on the surface of the body.

Beaumont oil has been found by the Bureau to be an effective dip for destroying cattle ticks. There are certain objections to its use, however, particularly an occasional injury to cattle. Experiments were therefore made to secure an emulsion which would remain uniform for an indefinite period. This was accomplished by employing a formula calling for 2 gal. crude petroleum, ½ gal. water, and ½ lb. hard soap. The soap is dissolved in hot water and the crude petroleum is added and mixed with a spray pump, after which it is diluted with the desired amount of water.

An emulsion of crude petroleum made in this way remains fluid indefinitely without any tendency to a separation of oil and water. Brief directions are also given for the preparation of emulsions and other oils.

The fumigation of dwelling houses for vermin, C. Fuller (*Natal Agr. Journ. and Min. Rec., 8 (1905), No. 5, pp. 457–464, fig. 1*).—Directions are given for the use of hydrocyanic-acid gas in destroying bedbugs, cockroaches, and other insects in houses. For large rooms several generators may be arranged, and care should be exercised to prevent one of them from being set in operation before the others if the attendant is still in the room. It is recommended that the period of fumigation be 6 to 8 hours if possible, but never less than 3 hours.

Key to the known larvæ of the mosquitoes of the United States, H. G. Dyar (*U. S. Dept. Agr., Bur. Ent. Circ. 72, pp. 6, fig. 1*).—This circular contains an analytical key intended for use in the identification of the known larvæ of mosquitoes.

House flies, L. O. Howard (*U. S. Dept. Agr., Bur. Ent. Circ. 71, pp. 2, figs. 2*).—This is a revision of Circular 35 (E. S. R., 10, p. 654).

The distribution of tsetse flies in French East Africa and in Kongo, A. Laveran (*Compt. Rend. Acad. Sci. [Paris], 141 (1905), No. 23, pp. 977–979*).—Brief

notes are given on the distribution of various species of Glossina and Tabanus in Senegal, French Kongo, New Anvers, the district of Ubangi, and other neighboring countries.

The horse botfly (*Jour. Bd. Agr.* [*London*], *12* (*1905*), *No. 2, pp. 108–110, figs. 2*).—The botfly is quite common in the central and southern part of England, but almost entirely absent from the northern part of the country. The common species observed in England is *Gastrophilus equi*, but it is considered desirable that the point should be determined whether other species also occur.

Observations on the bionomics of Auchmeromyia leuteola, F. C. Wellman (*Ent. News, 17* (*1906*), *No. 2, pp. 64–67, figs. 3*).—The larvæ of this fly is a blood-sucking maggot which has previously been referred to from South Africa. The author followed the complete life history of the species and gives notes on its method of attacking man.

Anatomy of Boophilus annulatus, S. R. Williams (*Proc. Boston Soc. Nat. Hist., 32, No. 8, pp. 313–334, pls. 5, figs. 3*).—The external anatomy, habits, and life history of the cattle tick have been quite thoroughly worked out. The present article, however, is apparently the first attempt to describe in detail the various features of the internal anatomy of the cattle tick.

It appears that the internal anatomy of this pest differs decidedly from that of *Ixodes ricinus* described in 1861 by Pagenstecher. In order to study the internal anatomy of cattle ticks it was found necessary to allow the body to shrink somewhat in alcohol. This makes it possible to remove the chitin which otherwise interferes with making sections. According to the author, the external porous areas on cattle ticks are sense organs. The alimentary canal is a slightly curved tube provided with 6 large diverticula, which occupy most of the body of the tick. The adult females appear to eject nothing from the alimentary canal or the renal organs.

Apiculture, T. W. Kirk (*New Zeal. Dept. Agr. Ann. Rpt., 13* (*1905*), *pp. 403–405, pls. 4*).—On account of the growing importance of the bee industry in New Zealand, it is recommended that an efficient expert be appointed for the purpose of giving instruction to bee raisers. The author has inspected about 2,500 colonies of bees, and brief notes are presented on foul brood, bee moth, and other troubles which affect the bee raiser.

Beekeeping: How to meet its dangers and difficulties, B. N. Gates (*Agr. of Mass., 52* (*1904*), *pp. 411–426*).—Statistics are given on the amount of honey produced in Massachusetts and certain other States with which Massachusetts is compared. In wintering bees it is essential that the colonies have plenty of stores and be given a uniform temperature, without too much moisture. Particular attention is given to the discussion of the bee moth, robbing, foul brood, and other diseases of bees.

Scientific queen raising, A. H. W. Clarkson (*Queensland Agr. Jour., 16* (*1905*), *No. 1, pp. 118–122*).—The author argues that it is useless to attempt to rear queens in weak colonies. The nuclei should be strong, since otherwise the necessary amount of food and the proper temperature can not be secured for the development of queens. As a standard for good queens it is considered that they should be able to lay from 2,000 to 3,000 eggs per day during the proper season of the year.

The method recommended by the author consists in transferring a frame of queen cells with royal jelly to a strong colony of bees which, at the time, is working vigorously in the upper part of the hive. Before this is done a couple of frames containing young larvæ could be removed from the lower to the upper story and a queen placed between the bottom and top story. As soon as the bees find that the brood is not increasing in the top story they proceed to raise a new queen.

Ventilation of bees, Devaucheelle (*Apiculteur, 50* (*1906*), *No. 1, pp. 10–14*).—The author presents a discussion of the phenomenon of bees ventilating the hive by wing movements at the entrance to the hive. It is believed that the purpose of this is to lower the temperature in the hive and renew the air in order to increase the evaporation of nectar.

Bees and the color of flowers, G. BONNIER (*Compt. Rend. Acad. Sci. [Paris], 141 (1905), No. 24, pp. 988–994*).—After carrying on numerous observations with regard to the attraction of the color of flowers for bees, the author comes to the conclusion that the color of flowers does not exercise any apparent influence upon the worker bee.

Catalogue of the exhibit of economic entomology at the Lewis and Clark Centennial Exposition, Portland, Oregon, 1905, R. P. CURRIE (*U. S. Dept. Agr., Bur. Ent. Bul. 53, pp. 127*).—This catalogue was designed to increase the usefulness of the exhibit of the Bureau of Entomology in Portland by furnishing information regarding the insects contained in that exhibit. The species represented were largely the same as those shown at the St. Louis Fair, but some insects of interest only to eastern localities were omitted.

FOODS—HUMAN NUTRITION.

Standards of purity for food products (*U. S. Dept. Agr., Office Sec. Circ. 17, pp. 7*).—The food materials for which standards are proposed include dried, evaporated, canned, and preserved fruits and similar products, flavoring extracts, oils used in the preparation of extracts, olive oil, cotton-seed oil, and other edible vegetable oils, and table salt.

A flavoring extract is defined as "a solution in ethyl alcohol of proper strength of the sapid and odorous principles derived from an aromatic plant, or parts of the plant, with or without its coloring matter, and conforms in name to the plant used in its preparation."

The various flavoring extracts described are intended solely for food purposes and, it is pointed out, are not to be confounded with similar preparations described in the Pharmacopœia for medicinal purposes.

This publication supplements a circular previously noted (E. S. R., 16, p. 894).

Legislation regulating the sale of foods (*Rev. Soc. Sci. Hyg. Aliment., 2 (1905), No. 6, pp. 467–640*).—A summary of laws regarding the regulation of foods, previously noted, is continued (E. S. R., 17, p. 59). The present installment includes Holland, Spain, Portugal, Sweden, Denmark, France, and the United States.

The microscopy of vegetable foods, A. L. WINTON (*New York: John Wiley & Sons; London: Chapman & Hall, Ltd., 1906, pp. XVI + 701, figs. 589*).—This volume, which was prepared with the collaboration of J. Moeller, summarizes the results of a large number of original investigations on the histology of products of vegetable origin, and is designed for the use of food analysts, agricultural chemists, pharmacists, and others engaged in the examination of foods, as well as the physician who may be called upon to identify vegetable substances in stomach contents and feces.

It has been the author's aim to make the volume comprehensive and to have it cover the important vegetable foods used by man and domestic animals, and to present the material in such form that it will be available for ready reference. In preparing the work the author states that leading authorities have been consulted and "credit has frequently been given for important discoveries, although so far as possible the writer has based his descriptions on his own observations." Laboratory equipment, methods, and general principles relating to the microscopical examination of vegetable food products are discussed.

The materials described and illustrated include grain and its products and impurities, oil seeds and oil cakes, legumes, nuts, fruit and fruit products, vegetables, alkaloidal products and their substitutes, spices and condiments, and commercial starches. The illustrations, very many of them from original drawings, are a special feature of the volume and add much to its value. A bibliography, glossary, and index are included. The volume as a whole is an important contribution to the subject of vegetable histology, which, both as a pure and applied science, has hitherto been taken up almost exclusively by European investigators.

Food products, A. L. WINTON ET AL. (*Connecticut State Sta. Rpt. 1905, pt. 2, pp. 107–144*).—Under the provisions of the State pure-food law 1,347 samples of milk, olive oil and substitutes, coffee, spices, chocolate, candies, jams, extracts, and similar products were examined, over half of the samples being collected by the station and the remainder submitted by the dairy commissioners and by health officers, consumers, and dealers. Of these samples 388 were adulterated or below the standard, 94 were compounds, while the remaining 865 were not found to be adulterated.

Cereal breakfast foods, C. D. WOODS and H. SNYDER (*U. S. Dept. Agr., Farmers' Bul. 249, pp. 36*).—The results of investigations carried on at a number of experiment stations on the digestibility and nutritive value of cereal breakfast foods are summarized, as well as general information on this important class of food products. Some of the questions discussed are the preparation of modern cereal breakfast foods, predigested and malted goods, cooking, the absorption of water by different cereals and their solubility, cost of cereal breakfast foods as compared with other foods, and the place of these foods in the diet. Information regarding the use of cereal products as coffee substitutes is also summarized.

"In the selection of cereal breakfast foods the consumer may be guided by the results of analyses of disinterested chemists, by the digestibility as determined by actual tests, by cost, by taste, by economy, or by the observed effects of the goods upon individuals. It seems fair to conclude that the chemical composition, considered in connection with digestibility and cost, furnishes a satisfactory guide for selection, due attention being paid to palatability and individual preferences.

"All things considered the cereal breakfast foods as a class are nutritious, convenient, and reasonably economical foods and worthy of an important place in the diet when judiciously combined with other foods."

Food and the principles of dietetics, R. HUTCHISON (*London: Edward Arnold, 1906, pp. 582; rev. in Brit. Med. Jour., 1906, No. 2362, p. 806*).—This handbook has been revised and some new material added, including among other topics a discussion of underfeeding.

Unpolished rice, H. S. CLUBB (*Philadelphia: Vegetarian Society of America, 1905, pp. 32*).—On account of its higher protein content the use of unpolished instead of polished rice is advocated. In addition to discussing the various topics connected with the use of rice in the diet the author has summarized a large number of recipes for preparing it for the table.

The digestibility of flour made from legumes, M. WINTGEN (*Veröffentl. Mil. Sanitätsw., 1905, No. 29, pp. 37–55; abs. in Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 4, pp. 225, 226*).—Artificial and natural digestion experiments with pea meal, bean meal, and lentil meal are reported. As shown by the experiments with man the pea meal was more digestible than the other sorts studied.

Preserved eggs and egg substitutes, A. BEYTHIEN and L. WATERS (*Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 5, pp. 272–274*).—Data are reported regarding the composition of egg powders and similar goods.

Chemical change produced in foods, etc. (*Pure Products, 2 (1906), Nos. 2, pp. 70–72; 3, pp. 118–120*).—A summary of data regarding the chemical changes due to micro-organisms, etc., which take place when food of different sorts is stored or preserved in different ways.

Preserved fruits in lacquered tins (*Lancet [London], 1906, I, No. 8, pp. 529, 530*).—Examination of fruits in tin cans with the interior surface lacquered showed that this method of treating the can prevented metallic contamination.

A number of experiments were made with this method of canning, using raspberries, strawberries, gooseberries, plums, blackberries, greengages, and damsons. "In no instance was there the least indication of any action on the tin and not a trace of tin could be found in the syrup, while the color of the fruit was satisfactorily preserved."

Pure British dried vegetables (*Lancet* [*London*], *1906, I, No. 11, p. 766*).—Commercial dried or evaporated vegetables are described, which are regarded as of good quality. It is stated that the condition of the food constituents was not changed by evaporation, the albumins of the dried product being still soluble. Color and freshness of flavor, it is stated, were also little affected.

The occurrence of esters in bananas, F. Rothenbach and L. Eberlein (*Deut. Essigindus., 1905, No. 9, pp. 81, 82; abs. in Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 4, pp. 230, 231*).—The authors report isovaleric-isoamyl ester and ethyl ester in bananas. The possible occurrence of amyl acetate is also noted. Experiments showed that ester formation did not depend upon micro-organisms, but was a product of cell activity.

Commercial extract of lemon, A. McGill (*Lab. Inland Rev. Dept.* [*Canada*], *Bul. 114, pp. 15*).—Considerable range in alcohol strength and in lemon oil content was noted. Of the 110 samples examined, 2 contained 6 per cent or more of lemon oil and 78 less than 1 per cent. No methyl alcohol was found.

Coffees without caffein, G. Bertrand (*Compt. Rend. Acad. Sci.* [*Paris*], *141 (1905), No. 3, pp. 209–211*).—According to the author's analyses, the berries of *Coffea gallienii, C. bonnieri, C. mogeneti,* and *C. humblotiana* contain no caffein. The ash, water, and total nitrogen in the samples were also determined. A sample of *C. mauritiana* contained only a very small percentage of caffein, namely, 0.7 gm. per kilogram. A sample of *C. arabica,* analyzed at the same time, showed 13.4 gm. caffein per kilogram.

Maple sugar and sirup, W. F. Hubbard (*U. S. Dept. Agr., Farmers' Bul. 252, pp. 36, figs. 9*).—This bulletin is based on a publication of the Bureau of Forestry previously noted (E. S. R., 17, pp. 774, 790).

Physiological studies of vegetarian diet, W. Caspari (*Arch. Physiol.* [*Pflüger*], *109 (1905), No. 11–12, pp. 473–595, pls. 3*).—Extended studies are reported of vegetarian and raw fruitarian diet. In connection with this work studies were made of the metabolism of nitrogen, the digestibility of the diet, and the effect of the food on the respiratory quotient. Two of the subjects were professional athletes, one a vegetarian, the other not. The general conclusions drawn were in effect as follows:

A strictly vegetable diet, even when made up of raw foods, is able to nourish the body in youth and maintain it at the highest degree of physical strength and mental and physical power, yet this sort of diet is considered unsatisfactory because the nutrients, particularly protein, are not well assimilated because the food is lacking in flavor and is of large volume. The vegetarian diet when made up of ordinary vegetables, fruits, etc., has an advantage in that it is not expensive.

It did not appear that the vegetarian diet surpassed the ordinary diet on account of the small amount of uric acid formed. As is commonly claimed the amount of purin bodies formed was small as compared with the quantity obtained with an excessive meat diet and under certain pathological conditions. As regards the performance of muscular work the vegetarian diet certainly is not superior to the ordinary mixed diet.

A respiration calorimeter with appliances for the direct determination of oxygen, W. O. Atwater and F. G. Benedict (*Washington, D. C.: Carnegie Institution of Washington, 1905, pp. X + 193, figs. 49*).—This volume includes a detailed description of a respiration calorimeter and accessory apparatus which the authors have devised for experiments with man, together with the results of check experiments to determine the accuracy of the apparatus and an experiment with man.

The respiration calorimeter has been in process of development for 12 years, and much of the work connected with it has been a part of the cooperative nutrition investigations of the Department of Agriculture and reported in Department publications (E. S. R., 15, p. 698, 17, p. 165). Under the auspices of the Carnegie Institu-

tion very important changes in the apparatus have been introduced and the method of experimenting has been modified to include the direct determination of oxygen. A quantity of air circulates through the apparatus and the carbon dioxid and water eliminated in the respiratory products are removed by passing the air current through soda-lime mixture and through sulphuric acid. As the air current passes back into the respiration chamber oxygen is added to make up for that used by the subject, the amount being determined by weighing the cylinder containing the oxygen before and after the addition is made.

The calorimeter may be fairly designated an instrument of precision and serves for the very accurate measurement of energy, carbon dioxid, water, and oxygen in experiments with man extending over a number of days, under various conditions of work and rest.

In connection with the experiments, the balance of income and outgo of nitrogen and other food constituents is taken into account so that the experiments furnish data for considering the total income and outgo of matter and energy in addition to the respiratory quotient.

"In experiments with man as carried out with this apparatus and acccessories, the following determinations of intake and output of material are made:

"The intake [as regards matter] consists of food, drink, and oxygen from respired air. The amounts are determined by weighing. The analyses include determinations of water, ash, nitrogen, carbon, hydrogen (organic), and at times sulphur and phosphorus. The output of material consists of products of respiration and perspiration, urine, and feces. The dry matter of feces and urine is subjected to a series of analyses similar to those for food, and the water and carbon dioxid of perspiration and respiration are determined according to the methods discussed in this report. The determinations of nitrogen in perspiration are made, when necessary. . . .

"[In the case of energy] the intake is derived from the potential energy, i. e., heats of combustion of the food. The output consists of sensible heat given off from the body, the latent heat of the water vaporized, and the potential energy, i. e., heat of combustion of the unoxidized portions of the dry matter of urine and feces. In certain cases, e. g., work experiments, a not inconsiderable portion of the output is in the heat equivalent of external muscular work. . . .

"The heats of oxidation are determined by burning the substances in the bomb calorimeter; the heat given off from the body is measured by the respiration calorimeter; the external work is measured by a specially devised ergometer. Allowance is made for heat introduced and removed by the ventilating air current, food, feces, and urine, and for that involved in changes of body temperature, which is also measured. . . .

"Since the completion of the new apparatus, 22 experiments with 5 different subjects, covering a total of 60 days, have been conducted. These experiments lasted from 1 to 13 days, during which time the subject remained inclosed in the calorimeter chamber. Ordinarily the experiment lasts 3 or 4 days. In general, each experiment is preceded by a preliminary period outside the chamber, during which the subject is given the special diet to be tested, and his habits of life so modified as to conform with those to be followed in the chamber. When the subject is to be engaged in muscular work, he devotes considerable time in the preliminary days to riding a bicycle in the open air, the amount of work performed being as nearly as can be judged equivalent to that to be done later on the bicycle ergometer inside the chamber.

"The food for the whole experimental period, including the preliminary days, is carefully weighed, sampled, and daily portions placed in proper containers ready for consumption. The more easily decomposed materials, such as milk and cream, are sampled, weighed, and analyzed each day. The bread and meat when used are

carefully sterilized in glass jars. The diet may be so planned as to maintain a uniform quantity of nitrogen and a constant calorific value from day to day."

Respiratory quotient in static work, II, A. Bornstein and A. Ott (*Arch. Physiol. [Pflüger], 109 (1905), No. 11–12, pp. 621–627*).—On an average of 17 experiments it was found that the work required in standing was equivalent to 156 calories per minute. Data are also given regarding the expenditure of energy when a pack was carried on the back.

Respiratory quotient in static work, III, A. Bornstein and B. von Gartzen (*Arch. Physiol. [Pflüger], 109 (1905), No. 11–12, pp. 628–633*).—The data reported have to do with the effect of weighting the chest on the oxygen consumed and the carbon dioxid excreted.

Alcohol, sugar, and caffein, and their effect upon muscular work, I. Ioteyko (*Rev. Soc. Sci. Hyg. Aliment., 2 (1905), No. 5, pp. 483–491, fig. 1*).—From experiments in which musular work was measured with an ergograph, the conclusion was reached that sugar is an excellent food, a direct source of energy in the muscles, and not an excitant. Caffein is considered as an excitant of the nervous system and, in the author's opinion, is of great importance as a tonic, though it has probably no nutritive value.

The after effect of muscular work upon water vapor secretion, H. Wolpert and F. Peters (*Arch. Hyg., 55 (1906), No. 3, pp. 309–322*).—The increased excretion of water vapor due to muscular work can be noted for several hours after the work has ceased.

The daily curve of water vapor excretion in man, H. Wolpert and F. Peters (*Arch. Hyg., 55 (1906), No. 3, pp. 299–308, dgm. 1*).—From their investigations the authors conclude that neither the time of day nor the diet is a direct cause of variation in the amount of water vapor excreted. The average amount excreted per day was 1,650 gm. at, in still air, a temperature of 24° C. and containing 65 per cent moisture.

Observations on creatin excretion in man, C. J. C. Van Hoogenhuyze and H. Verploegh (*Ztschr. Physiol. Chem., 46 (1905), No. 5–6, pp. 415–471, figs. 8*).—In the experiments reported muscular work did not exercise any marked effect on the excretion of creatin except in the case of a fasting subject, when an increase was noticeable. Gelatin and casein added to the ration did not increase creatin excretion, and the addition of 5 eggs caused only a slight increase. Other questions relating to creatin formation and excretion were also studied and the investigation as a whole is discussed with reference to Folin's theory of nitrogen metabolism.

Report of the departmental committee on vagrancy, J. L. Wharton et al. (*London: Wyman & Sons, Ltd., 1906, pp. VI + 123*).—The housing, care, and management of vagrants, and their relation toward other classes are considered, one of the questions taken up being the dietary for casual wards and labor colonies. The dietary recommended for casual wards would cost about 39 cts. per head per week and would furnish 63 gm. protein and 2,500 calories per head per day, and that recommended for labor colonies would cost about 33 cts. per head per week and furnish 66 gm. protein and 2,236 calories per head per day.

ANIMAL PRODUCTION.

Commercial feeding stuffs, E. H. Jenkins and A. L. Winton (*Connecticut State Sta. Rpt. 1905, pt. 3, pp. 145–188*).—The feeding stuffs examined under the State law included cotton-seed meal, linseed meal, rape-seed meal, wheat bran, wheat middlings, wheat mixed feed, maize meal, gluten meal and feed, hominy feed, rye feed, malt sprouts, dried distillery grains, buckwheat middlings, alfalfa meal, miscellaneous mixed feeds, proprietary horse feeds, proprietary and other dairy and stock feeds, proprietary poultry feeds, beef scrap, and meat meal.

"The examinations of these feeds show that in many cases the dealers do not give the guaranties, as required by law. When given, they are too often misleading, being much higher than the composition of the goods warrants. This is especially noticeable in the gluten meals and gluten feeds.

"The mixtures of wheat feed and corncobs, formerly sold, illegally, as 'wheat feed,' are now sold under distinctive names and with a guaranty; thus complying with the law.

"There are still on the market a large number of low-grade mixed feeds, of very moderate feeding value, but sold for only a few dollars per ton less than the standard high-grade feeds."

In most cases a feeder can not use to advantage any boughten feed containing less than 15 per cent of protein.

"Ready-mixed feeds, made of a number of by-products or factory wastes, may wisely be let alone, unless the buyer can see for himself out of just what raw material the mixture is being prepared. Low grade, damaged corn, shriveled wheat, peanut refuse and wheat screenings containing many weed seeds, are not infrequently found in such feeds by careful examination, but are not easy for the buyer himself to recognize."

Commercial feeding stuffs sold in Maryland, H. B. McDonnell et al. (*Md. Agr. Col. Quart., 1905, No. 30, pp. 7*).—The protein and fat were determined under the State feeding-stuff law in a number of samples of meat meal and other poultry feeds of animal origin, cotton-seed meal, linseed meal, unpressed flaxseed meal, gluten feed, molasses grains, wheat middlings, alfalfa meal, short-cut alfalfa, dried distillers' grains, wheat bran, wheat middlings, proprietary poultry feeds, pigeon feed, ground oats, sugar-beet pulp feeds, corn bran, and mixed and proprietary feeds. "We have reason to believe that ground peanut hulls are being used to some extent to adulterate feeds, probably bran, and purchasers should be on the lookout for this, as the hulls are worthless as a feed."

Concentrated feeding stuffs, J. P. Street, W. P. Allen, and V. J. Carberry (*New Jersey Stas. Bul. 193, pp. 38*).—The feeding stuffs examined under the State pure-food law included cotton-seed meal, linseed meal (old process), germ meal, gluten feed, corn bran, hominy meal and similar goods, distillers' and brewers' grains, malt sprouts, molasses grains, mixed and proprietary feeds, biscuit refuse, biscuit refuse and milk, alfalfa meal, barley feed, dried sugar beet pulp, meat meal and proprietary poultry feeds, calf meal, wheat bran, wheat middlings, feeding flour, wheat feed, rye bran, rye feed, corn meal, corn-and-cob meal, mixed ground grains, buckwheat middlings, buckwheat bran, and buckwheat feed.

"Of the 125 different brands of feed received, and which should have been guaranteed, four failed to meet this requirement.

"Of the 241 samples which were guaranteed, 90 were deficient, 71 of these being low in protein.

"Of the 103 samples which did not require a guarantee, all were pure products, but the wheat brans and feeding flours were below normal quality.

"No direct adulteration is reported, but there are a number of feeds on the market whose composition does not warrant the high guarantees they carry.

"The purchaser of protein will rarely find any feed containing less than 15 per cent of protein a desirable or an economical purchase, and in all cases a strict regard must be given to the amount of nutrients guaranteed and the prices asked for the same."

Third report on concentrated feeding stuffs and cotton-seed meal, B. W. Kilgore, C. D. Harris, and J. C. Phelps (*Bul. N. C. Dept. Agr., 26 (1905), No. 11, pp. 63, figs. 7*).—Under the provisions of the State feeding-stuff law 534 samples of wheat bran, wheat middlings, bran and shorts, ship stuff, oat feeds, corn and oat feeds, rice meal, rice feed, peanut bran, peanut feed, molasses or sugar feeds, malt sprouts, gluten feed, hominy feeds and chops, cotton-seed meal, cotton-seed hulls, cotton-seed feeds, and mixed and proprietary feeds.

About one-third of the samples of wheat bran were found to contain corn bran, rice chaff, and peanut shells. One-third of the samples of bran and shorts were also found to be mixtures. In the case of corn and oat feeds, molasses feeds, hominy feeds, cotton-seed feeds, and mixed and proprietary feeds most of the samples were of good quality. In the case of other classes of goods analyzed a larger proportion of the goods were below the standard. "Good grades of cotton-seed meal contain 43 per cent or more of protein. This means that they have about 7 per cent of nitrogen, which is equal to 8.5 per cent of ammonia. Meals in past years especially have not infrequently been considerably higher than this." Of the 120 samples examined 37 were below the standard, 7.5 per cent ammonia.

Commercial feeding stuffs, J. L. HILLS, C. H. JONES, and F. M. HOLLISTER (*Vermont Sta. Bul. 117, pp. 8*).—Some 150 samples of commercial feeding stuffs were collected for examination under the State law in the spring of 1905. These included cotton-seed meal, linseed meal, gluten meals and feeds, distillers' dried grains, oat feeds, corn and oat feeds, hominy feed, sugar feed, ground beef scraps, wheat offals, and provenders.

Commercial feeding stuffs, J. L. HILLS and C. H. JONES (*Vermont Sta. Bul. 118, pp. 9–16*).—In the autumn of 1905, 270 samples of commercial feeding stuffs were collected for inspection under the State law, including cotton-seed meal, linseed meal, gluten meals and feeds, distillers' dried grains, oat feeds, corn and oat feeds and similar goods, hominy feeds, mixed feeds, molasses grains, molasses beet pulp, alfalfa meal, calf meal, provenders, and wheat offals. The cotton-seed meals contained 41.5 per cent protein as compared with 44 per cent found in the samples on sale in the State up to a year or two ago. A low protein content has been observed elsewhere and has been attributed to general crop conditions.

Olive pomace as a feeding stuff, E. MARCHI (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 163–172*).—From a study of the composition of olive pulp and a summary of data regarding its feeding value, the conclusion is reached that this material can be used in the feeding of farm animals, but that it should be mixed with some material which is low in fat and carbohydrates, such as legumes, commercial by-products, skim milk, casein, dried blood, etc.

Adulteration of feeding stuffs, C. GOTUSSO (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 205–209*).—Work connected with feeding-stuff inspection in Italy is spoken of. The author believes that chemical analysis furnishes a satisfactory basis for such work.

Alfalfa for the growing and fattening of animals in the Great Plains region, I. D. GRAHAM (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 86, pp. 242–267*).—This is reprinted from the annual report of the Bureau for 1904 (E. S. R., 17, p. 686).

The effect of the ration on the value of the manure, J. M. BARTLETT (*Maine Sta. Bul. 126, pp. 45–48*).—In digestion experiments with steers the potash and phosphoric acid in the excretory products were determined, as well as the nitrogen. The rations were made up of hay alone and with spring and winter wheat bran and cotton-seed meal. The following table summarizes the values found:

The money value of the fertilizing elements excreted on each ration and per 100 lbs. of each feed.

Ration.	Nitrogen.	Phosphoric acid.	Potash.	Total value.
	Cents.	*Cents.*	*Cents.*	*Cents.*
Hay alone	5.36	0.39	2.98	8.73
Hay and spring wheat bran	10.40	2.03	3.95	16.38
Hay and winter wheat bran	9.52	1.67	3.70	14.89
Hay and cottonseed meal	15.30	1.32	3.95	20.57
100 lbs. hay	13.50	.98	7.45	21.93
100 lbs. spring wheat bran	37.80	11.91	8.93	58.64
100 lbs. winter wheat bran	31.90	8.85	7.27	48.02
100 lbs. cottonseed meal	99.40	9.30	9.60	118.30

"In the first experiment with hay alone, more nitrogen was found in the excretions than was taken in the food. This discrepancy was probably due to insufficient nitrogen in the ration to maintain the animals and they lost flesh, excreting some body nitrogen. . . .

"The larger part of the nitrogen, the most expensive element, and potash are given off in the urine, hence the importance of saving all of this most valuable part of the manure. Not only are other elements found in large quantities in the liquid, but they are in much more available form than in the solid. Only traces of phosphoric acid were found in the urine."

The nitrogen balance in the nutrition of ruminants, A. Gouin and P. Andouard (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 122–124*).—Data are reported regarding the proportion of nitrogen excreted in the urine and feces. The authors believe that such data should be used with caution, especially when it is remembered that the food material remains a long time in the digestive tract of Herbivora.

Concerning the assimilation of protein in the animal body, E. Abderhalden and F. Samuely (*Ztschr. Physiol. Chem., 46 (1905), No. 1–2, pp. 193–200*).—The examination of the blood of horses under different conditions showed that the protein of food was without influence on the composition of serum proteid.

The nutritive value of amids, B. von Strusiewicz (*Ztschr. Biol., 47 (1905), p. 143*).—From experiments with sheep the author concludes that amids have the same value as proteids, a deduction not in accord with the consensus of opinion of other investigators.

Phosphates in the ration of young animals, Rasquin (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 62–68*).—The work of other investigators is summarized and tests briefly reported in which rations with and without added phosphate (ground bone) were studied with chickens. On a powdered bone ration the gain in weight was greater and the skeleton was heavier and contained a larger amount of lime and phosphoric acid. Mineral phosphates, the author concludes, are of value in the feeding of young animals.

Watering farm animals, P. Wery (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 86–91*).—Various questions concerned with the wholesomeness of the water supply are taken up. The author recommends that more public watering troughs be provided which will give a constant supply of water of good quality.

Proceedings of Second International Congress for the Rational Feeding of Farm Animals (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Compt. Rend., pp. 192*).—The programmes, list of members, proceedings, etc., of the Second International Congress for the Rational Feeding of Farm Animals, which was held in 1905 at the Universal Exposition at Liège.

Résumé of the principal experiments on cattle feeding which have been carried on in the low countries, J. J. O. de Vries (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 149–162*).—Dutch investigations on cattle feeding are summarized. The author believes that rations which have given satisfactory results in practice should be studied by scientific methods.

Feeding experiments with cattle designed for fattening and pasture, L. Bauwens (*2. Cong. Internat. Aliment Ration. Bétail, 1905, Raps., pp. 144–148*).—Belgian studies are summarized comparing horse beans with and without other concentrated feed for young cattle, but conclusions are not drawn.

Experiments on fattening calves, F. Smeyers (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 197–204*).—The tests reported show that feeding whole milk to calves is not profitable.

Data are summarized regarding skim milk supplemented by other feeds, and attention is directed to the bad results which were obtained in the feeding of sour milk. The author believes that the question of the better utilization of skim milk

should be studied and that the degree of acidity which may be permitted without harm should be determined.

Cost of maintenance and growth of ruminants, A. Gouin and P. Andouard (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 115–121*).—On the basis of experimental evidence, the authors conclude that the energy required for a kilogram of gain in body weight is about 1,200 calories per square meter surface area. Powdered bone is considered an important aid in practical feeding.

Western feeds for beef production, J. G. Haney and O. H. Elling (*Kansas Sta. Bul. 132, pp. 21–52, figs. 9*).—Using 64 grade Shorthorn and Hereford cattle divided into 8 uniform lots, the value of corn-and-cob meal and Kafir corn meal with alfalfa hay, with Kafir corn hay, and with sorghum hay was studied, as well as ground wheat with alfalfa hay, and a mixed ration containing all the other feeding stuffs enumerated.

The greatest gain in the 152 days of the test, 338 lbs., was noted with the lot fed corn-and-cob meal and alfalfa hay, and the smallest gain, 160 lbs., with the lot fed ground Kafir corn and sorghum hay. Generally speaking, the lots fed the rations containing alfalfa hay and the mixed ration made larger gains than the other lots.

The cost of a pound of gain ranged from 5.13 cts. with the corn-and-cob meal and alfalfa hay ration to 11.74 cts. on ground Kafir corn and sorghum hay.

In the case of the lots fed ground grain and alfalfa hay the dressed weight was on an average 60 per cent of the live weight in round numbers. In the case of the other lots it was somewhat lower. Other data regarding the slaughter test are recorded.

"For beef production, ground Kafir corn is about equal, pound for pound, to corn-and-cob meal when alfalfa hay is fed with either of these concentrates. . . . Ground wheat and alfalfa hay, fed together, is not an economical ration for beef on account of the loosening effect of these feeds on the steers and the expensiveness of the wheat. . . .

"A matter of this experiment of considerable interest, especially to the western farmer, is the part that the various roughages play in beef production. . . . One bushel of corn-and-cob meal fed with alfalfa hay as roughage produced 11.8 lbs. of flesh, while the same amount of corn-and-cob meal fed with sorghum hay as a roughage gave in return only 6.25 lbs. of flesh; thus, a difference of 5.5 lbs., or 88 per cent in favor of the alfalfa hay ration. . . .

"It is the opinion of the writer that the western feeds grown without irrigation have the chief food constituents in a slightly different proportion from those grown under more favorable conditions, though the nutritive ratio of the rations fed and the profit per steer have a direct relation to each other. For practical work the results would be little changed by this difference in composition."

Highland cattle, J. Roberts (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 88, pp. 227–241*).—This is reprinted from the annual report of the Bureau for 1904 (E. S. R., 17, p. 689).

Pigs and bacon (*Jour. Jamaica Agr. Soc., 10 (1906), No. 3, pp. 108–110*).—Data are summarized showing that bacon curing may be profitably carried on in Jamaica with local-grown pigs. The majority of the local feeding stuffs, it is pointed out, are very rich in carbohydrates and tend to produce fat rather than flesh. The pulp remaining after cotton-seed oil is expressed, peas, and cowpeas are spoken of as very satisfactory feeds for pigs raised for bacon.

Feeding of horses, E. Lavalard (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 13–27*).—A summary and discussion of recent horse-feeding experiments in France, particularly those carried on upon a large scale.

Influence of foods containing sugar upon the digestibility of rations of horses, J. Alquier (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Raps., pp. 1–13*).—On the basis of experimental evidence it is stated that sugar did not appreciably affect the digestibility of the nutrients of a ration even when as much as 5 or 6 kg.

per 1,000 kg. body weight was consumed. Sirup and molasses in smaller quantities, however, decreased digestibility, a fact which is explained by the laxative properties of the alkaline salts in beet molasses.

The toxicity and hygienic and therapeutic rôle of the mineral matter of molasses for horses, J. Alquier (*2. Cong. Internat. Aliment. Ration. Bétail, 1905, Rapp., pp. 69–85*).—From the experimental evidence presented the conclusion was drawn that molasses is harmless and a hygienic nutritive material when the amount consumed per day does not exceed 3 or 4 kg. per horse.

Hunter-horse production in Ireland, W. J. Kennedy (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 87, pp. 187–225, pls. 8*).— This is reprinted from the annual report of the Bureau for 1904 (E. S. R., 17, p. 691).

The poultry industry of Petaluma, California, P. H. Lawler (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 92, pp. 316–322, pls. 3*).—This is reprinted from the annual report of the Bureau for 1904 (E. S. R., 17, p. 692).

DAIRY FARMING—DAIRYING—AGROTECHNY.

The influence of changes in feeding upon milk production, J. L. Hills (*Vermont Sta. Rpt. 1905, pp. 341–376*).—This is a compilation and discussion of the data obtained in the feeding trials reported in the tenth to the sixteenth annual reports of the station (1896–1903), inclusive, and relates to the effect upon production of changes in the total and digestible dry matter, digestible protein, digestible carbohydrates, and calories. Many deductions are made from the numerous tables which show in a condensed form, food consumption; production of milk, total solids, and fat with the food cost of each; and production proportioned to food consumption.

Among the author's generalizations are the following:

"(1) The testimony afforded by the results as between different rations and the same ration fed in different amounts is so nearly alike, speaking broadly, that one may safely group them together and argue on the basis of variations in dry matter or in nutrient consumption regardless of their origin.

"(2) When like quantities of the several nutrients were eaten, production was unaltered.

"(3) A 6 per cent increase or decrease in total dry matter eaten was accompanied by a corresponding 2 per cent change in yield; a 10 per cent increase or decrease, by a 5 per cent change in yield. . . .

"(4) A 7 per cent increase or decrease in digestible dry matter eaten was accompanied by a 3 per cent change in yield; a 12 per cent increase or decrease, by a 6 per cent change in yield; or, in other words, as food varied so did the yield, but to a less degree. . . .

"(5) As for digestible dry matter, so for digestible carbohydrates and for calories, word for word and, essentially, figure for figure.

"(6) A 3 per cent increase or decrease in digestible protein eaten had no effect on production; a 7 per cent increase or decrease was accompanied by a 2 to 3 per cent change in yield; and a 22 per cent increase or decrease by a 4 to 5 per cent change. . . .

"(7) A change in feeding of from more than to less than 15.5 lbs. of digestible nutrients or vice versa caused more decided changes in yield than did modifications in feeding on either side of that line, the average figures being 7 per cent and 4 per cent.

"(8) The nutritive ratio changes were evidenced in production fluctuations much as were those of digestible protein; when it narrowed, production generally increased, and vice versa.

"(9) The ultimate effect of a given food supply upon the milk flow is doubtless the more or less composite result of several coincidently active factors, including, primarily changes in the amounts of digestible nutrients taken as a whole; secondarily, changes in the amounts of digestible protein, and, probably, modifications in the proportions of digestible nutrients consumed in concentrates and in roughage.

"The writer's study of these data leads him to the conclusion that as a whole they do not support the doctrine which lays extreme stress on the paramountcy of protein; that they indicate that a ration with a nutritive ratio wider than 1:6, perhaps as wide as 1:7, or, indeed, in some cases one slightly wider, may prove economically as effective as the traditional 1:5.4; that a sufficiency of nutrients, affording enough available energy for bodily needs, if carrying a fair amount of digestible protein, not necessarily as much as 2.5 pounds, may prove economically as serviceable as does a richer ration."

Feeding trials with cows, J. L. HILLS (*Vermont Sta. Rpt. 1905, pp. 377–404, 428–462*).—In the feeding experiments conducted during the year on the same general plan as in previous years (E. S. R., 17, p. 284) tests were made of India wheat meal, hominy feed, cotton-seed meal, and linseed meal, and further data were secured on the extent of experimental error in feeding trials. The experiments included 42 cows and covered a period of 25 weeks.

"*India wheat meal,* used in medium to small amounts, seemed a fair substitute, pound for pound, for wheat bran, and nearly so for a mixture of equal parts of cotton-seed and linseed meals, an outcome which its analysis would not have led one to expect and which has been confirmed by the concordant results of two seasons' trials.

"*Hominy feed* proved superior as a milk maker to a rather inferior grade of wheat bran, but did not appear to be the equal of cotton-seed and linseed meals, nor was it as economical a concentrate to use. This outcome has, likewise, the coincident testimony of two years' trials to back it.

"*Cotton-seed meal,* as compared with linseed meal, seemed to possess a small though measurable advantage as a milk and butter making by-product; and since it cost less and carried a greater plant-food content, it proved economically preferable."

When 6 to 8 animals are fed by the alternation system, it is believed that the experimental error may be held to be a negligible quantity.

A comparison of feeding trial methods, J. L. HILLS (*Vermont Sta. Rpt. 1905, pp. 405–412*).—The results obtained during the year agreed with those previously reported, showing, in the opinion of the author, that the simple alternation system of conducting feeding trials is preferable to the combined method, but that the testimony of both is better than that of either alone.

Influence of sesame feeding on the yield of milk and the quality of milk, butter, and cheese, MOSER, PETER, and KAPPELI (*Jahresber. Molk. Schule Rütti-Zollikofen, 18 (1904–5), Beilage; abs. in Milchw. Zentbl., 2 (1906), No. 5, pp. 229–232*).—Sesame meal to the extent of 1 kg. per head daily produced a satisfactory increase in the yield of milk, but when increased to 1½ kg. was relatively less satisfactory.

The fat content of the milk showed no marked variations due to the feeding. The cheese was apparently unfavorably influenced by the larger quantities of sesame meal fed. The butter was regularly of good quality, although the opinions of the experts were not unanimous as regards the influence of this material on the quality of butter. In any case the influence on the butter was very small. With reference, therefore, to cheese making it is recommended that the quantity of sesame meal be limited to 1 kg. per head daily.

Influence on the fat content of milk of palm-nut cake as compared with rape-seed cake and peanut cake, T. VON SZANKOWSKI (*Inaug. Diss., Univ. Halle, 1905; abs. in Milchw. Zentbl., 2 (1906), No. 5, p. 234*).—The author concludes that the palm-nut cake rich in fat exerts a favorable influence on the fat content of milk, the

cake poor in fat exerting more influence on the quantity of milk. The addition of oil acts unfavorably on both the yield and the fat content of the milk which, however, is not the case when the oil is present in the material in a natural state. Rape-seed cake in comparison with palm-nut cake increased the yield of milk but had no influence on the fat content. Peanut cake increased the yield of milk and fat only at the beginning of the feeding period.

Suggestions for construction of a modern dairy barn (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 90, pp. 6, figs. 2*).—It is the aim of this circular to present a plan for a dairy barn embodying the best ideas in scientific and sanitary construction consistent with practicability and cheapness.

Dairying at Park Royal, 1905, E. Mathews (*Jour. Roy. Agr. Soc. England, 66 (1905), pp. 93–111*).—Tests of the butter and milk production of a number of cows of different breeds exhibited at the show of the Royal Agricultural Society in 1905 and several butter-making experiments are reported. The experimental work was largely for the purpose of furnishing object lessons and consisted in making butter from milk obtained after short and long periods of secretion, comparing butter made from the milk of different breeds, churning at different temperatures, etc.

Record of the station herd for 1904–5, J. L. Hills (*Vermont Sta. Rpt. 1905, pp. 422–427*).—Records of 52 cows for the year are reported. Some of the average results are as follows: Yield of milk 5,343 lbs., fat content 5.25 per cent, total solids 14.73 per cent, yield of butter 323.6 lbs., cost of food $58.31, and proceeds from sale of butter $96.93.

On the variations in the constituents of cows' milk during the course of lactation, F. Prachfeld (*Inaug. Diss., Univ. Leipzig, 1905; abs. in Milchw. Zentbl., 2 (1906), No. 5, pp. 228, 229*).—The greatest variations in individual constituents occurred during the second and third months and at the close of the lactation period. Variations in fat, sugar, proteids, and ash decreased in the order mentioned. In general, the percentages of fat, proteids, and ash in the milk increased and the percentage of sugar decreased from the beginning to the second or third month of the lactation period, from which time on until the end of the period these relations were reversed.

Investigations on the relations of the properties of the blood (erythrocytes and hemoglobin) to the productive capacity of milch cows, E. Schultz (*Fühling's Landw. Ztg., 55 (1906), No. 8, pp. 272–286*).—The investigations, which were made with 3 dairy herds, consisted in counting the red blood corpuscles and estimating the hemoglobin.

The red blood counts were found to be influenced by the age of the cows, stage of pregnancy, variations in altitude, and other causes. Averaging the data for the cows 4 to 6 years of age and of moderate productive capacity, a blood count of 6,320,000 erythrocytes per cubic millimeter was obtained for one herd, the production of which was 2,400 kg. of milk containing 3.76 per cent of fat; 6,640,000 for another herd producing 3,400 kg. of milk containing 3.08 per cent of fat; and 6,960,000 for a third herd producing 4,000 kg. of milk containing 4.01 per cent of fat, indicating a relation between the yield of milk and fat and the number of red blood cells.

The number of red blood cells showed a tendency to increase until the animals reached the age of 4 to 6 years, after which there was a decrease. There was also a decrease in the later stages of pregnancy. More dependence was placed upon the blood counts than upon the hemoglobin estimations, but in general the two determinations varied proportionately. With animals in advanced pregnancy and those kept at high altitudes the hemoglobin was relatively increased, while with young animals and those very productive the proportion of hemoglobin to red cells was reduced. A high content of hemoglobin and a high blood count are considered favorable to milk secretion, and it is suggested that these might be increased by breeding.

On the lecithin content of milk, W. Koch (*Ztschr. Physiol. Chem., 47 (1906), No. 4–6, pp. 327–330*).—What has heretofore been reported as lecithin, the author considers a mixture of lecithin and cephalin. The two substances may be separated by precipitation of the cephalin from an alcoholic solution by means of an ammoniacal solution of lead acetate. Both lecithin and cephalin are considered present in milk in sufficient quantities for estimation. Failure to find lecithin in milk is believed to be due to the common error of treating lecithin as a fat and extracting with ether. Lecithin, however, does not behave the same as a fat and in separating milk it remains for the most part in the skim milk rather than being removed in the cream.

A comparison of the composition of the casein of human, cows', and goats' milk, E. Abderhalden and A. Schittenhelm (*Ztschr. Physiol. Chem., 47 (1906), No. 4–6, pp. 458–465*).—From 200 gm. of water-free casein prepared from goats' milk, the authors obtained by hydrolysis, alanin 3 gm., leucin 14.8 gm., prolin 9.24 gm., phenylalanin 5.5 gm., glutaminic acid 22.5 gm., aspartic acid 2.2 gm., and tyrosin 9.9 gm. From 7 gm. of casein prepared from human milk 0.33 gm. of tyrosin and 0.28 gm. of glutaminic acid were obtained in the same manner. The albumin from human milk yielded 1.26 per cent of tyrosin and 0.98 per cent of glutaminic acid, the latter being considered much too low.

Preliminary communication on the glycocoll content of milk proteids, E. Abderhalden and A. Hunter (*Ztschr. Physiol. Chem., 47 (1906), No. 4–6, pp. 404–406*).—From a mixture of albumin and globulin prepared from cows' milk there were obtained by hydrolysis with hydrochloric acid, glycocoll, alanin, leucin, prolin, phenylalanin, glutaminic acid, and aspartic acid. Whether the glycocoll comes from the albumin or globulin or both is yet to be determined. The quantity is small, only 1.2 gm. of the ester being obtained from 100 gm. of the albumin or globulin.

A comparison of udder conformation and of milk production, J. L. Hills (*Vermont Sta. Rpt. 1905, pp. 419–421*).—Five cows classed as having well-balanced udders produced on an average 5,725 lbs. of milk and 342 lbs. of butter yearly for an average of 3 years; 18 cows having fairly well-balanced udders, 5,377 lbs. of milk and 333 lbs. of butter yearly for 3.5 years; and 11 cows having poorly formed udders, 5,219 lbs. of milk and 324 lbs. of butter yearly for 3.6 years.

A comparison of the yield of the fore and hind quarters was made with 5 cows, the results showing a yield of 46 per cent for the fore quarters and 54 per cent for the hind quarters, the quality being practically identical. The results were the same whether the fore quarters or the hind quarters were milked first.

A trial of the Hegelund or Danish method of milking, J. L. Hills (*Vermont Sta. Rpt. 1905, pp. 412–418*).—The Hegelund manipulation method was compared with extra-thorough stripping. The tests were made with 7 cows and covered 3 or 4 periods of 5 weeks' duration each.

When the Hegelund method was employed the first portion of the milking obtained in the ordinary manner was reduced in quantity and slightly in quality, but when taken with the residual milk obtained by manipulation the two portions together showed an increase in yield and a slight tendency toward better quality. With extra stripping the first portion showed likewise a reduction in quantity and quality, but when the strippings were added there was a gain in yield in but a single instance.

More food was consumed by the cows when the two special methods were employed, obviously introducing, according to the author, an element of doubt as to how much of the gain was due to manipulation and how much to increased food consumption.

The increased yield obtained by the Hegelund method was considered hardly more than sufficient to pay for the extra labor involved while the extra stripping was done at a loss.

"If, as is probably the fact, the persistency of the milking habit and the more per-

fect development of the udder are encouraged by either procedure, its adoption has considerable justification, particularly with heifers. This phase of the matter, however, is not included within the scope of the present inquiry. On the other hand, the additional load of dirt, dandruff, hair, dried manure, bacteria, etc., which fall into the milking pail because of the udder manipulation, is a distinct detriment, which, however, the use of some of the covered pails would go far to obviate."

The economic production and distribution of clean milk, J. Roby (*Jour. Amer. Med. Assoc., 46 (1906), No. 19, pp. 1430–1432*).—This discussion relates particularly to the milk supply of Rochester, New York.

Average monthly counts for 6 years showed the presence of about 100,000 bacteria per cubic centimeter in the milk supply of that city in winter and about 500,000 in summer. Notwithstanding the practical assurance of an increase of 3 cts. per quart in the price of milk, only one farmer was found who was willing to undertake the production of certified milk. In this instance the milk which was produced without expensive equipment showed on an average of 100 determinations the presence of only 3,853 bacteria per cubic centimeter.

In supplying milk to cities the author suggests the use of pails or cans holding about 15 qt. for milking, shipping, and, if desired, for delivering milk. After emptying, the cans are sent to a plant in the city where they are washed by machinery, covered with cheese cloth and a metal cover, and over both a stout canvas cover, and then sterilized by dry heat. The cans are then returned to the farm, where the canvas and metal covers are removed and the milk drawn directly through the cheese cloth into the can. The strainer is then removed and returned to the sterilizing plant with the canvas cover. The cans are at once covered and the milk is cooled by placing the cans immediately in ice water.

Investigations of the causes of the low Reichert-Meissl numbers of Holland butter, A. J. Swaving (*Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 9, pp. 505–520, dgms. 5*).—From September 15 to December 19, 5 groups of 4 cows each were fed different rations supplementing grass or hay and linseed cake and determinations were made of the Reichert-Meissl number of the butter made from the milk of each animal.

The content of volatile fatty acids was increased by fodder beets and by lucern silage. Grass silage exerted little or no influence as did also barley meal and sugar when fed as supplements to pasture and linseed cake. The Reichert-Meissl number was lowered by hay and linseed meal alone. While it is not yet clear in what manner the beets influence favorably the Reichert-Meissl number, the author considers that there is now better support for the previously expressed view that easily decomposed carbohydrates, such as sugar, favor the formation of volatile fatty acids only when fed along with materials already undergoing fermentation or easily fermented, such as fodder or sugar beets.

Bacteriological examinations of butter, A. Reitz (*Centbl. Bakt. [etc.], 2. Abt., 16 (1906), No. 7–9, pp. 193–212*).—This is a review of the literature on the occurrence of tubercle bacilli in butter, the bibliography given containing reference to the publications of 73 investigators. The author examined 100 samples of butter obtained in Stuttgart by means of inoculation experiments with animals. The results for 6 samples were inconclusive. In 8 or 8.5 per cent of the remaining samples, tubercle bacilli were found present.

Casein as an adulterant of butter, R. Racine (*Ztschr. Öffentl. Chem., 12 (1906), No. 9, pp. 169, 170*).—A sample of adulterated butter showed the presence of 5.49 per cent of casein and 24.73 per cent of water.

The chemical composition of whey and curd during the manufacture of Emmenthal cheese, G. Koestler (*Mitchw. Zentbl., 2 (1906), No. 5, pp. 193–224*).—According to the results of the author's investigations, the addition of rennet changes the chemical composition of the milk only to the extent of increasing the content of

soluble nitrogenous substances, the inclusion of which in the cheese may be regulated to a certain extent by manipulative methods.

At the time of cutting the curd, the whey shows, for the first few minutes, a decrease in the percentages of fat and proteids due probably to the effect of delayed coagulation, but later the fat content of the whey is increased. The acidity of the whey decreases during the process of manufacture due especially to the disappearance of carbon dioxid. The average of 38 determinations showed a decrease in acidity of 0.41 cc. of one-fourth normal potassium hydroxid per 100 cc. of whey. The total ash in whey decreases during the manufacturing process, the water soluble portion, however, showing an increase. The percentages of phosphoric acid and calcium are decreased.

The paracasein shows no changes in composition while in the kettle. The coagulating power of the whey due to the rennet remains constant until destroyed by the heating. A rapid increase in the acidity of the expressed whey is apparently due to an increase in the concentration of the whey and to lactic-acid fermentation.

Note on Dutch cheese, C. H. Cribb (*Analyst, 31 (1906), No. 361, pp. 105–111*).—Analyses are reported of 25 samples of Edam, Gouda, and other types of cheese imported into England from Holland. Many of these samples showed less than 5 per cent of fat and were consequently considered as made wholly from skim milk. Failure to secure conviction in a trial for adulteration was due to the want of any standard for such cheese.

Carbonated milk, L. L. Van Slyke and A. W. Bosworth (*Abs. in Science, n. ser., 23 (1906), No. 592, p. 712*).—Fresh milk treated with carbon-dioxid gas under pressure of 60 to 70 lbs. kept from 10 days to 2 weeks at a temperature of 60 to 70° F. and made a very palatable, refreshing beverage. Further work is to be done along this line before the detailed results of the experiments are to be published.

Artificial milk, R. Racine (*Ztschr. Öffentl. Chem., 12 (1906), No. 9, pp. 167, 168*).—An examination of a so-called artificial milk showed it to be a mixture of sirup and sesame oil emulsified with some proteid substance. This, diluted by the addition of 9 parts of water, is recommended for use in bakeries as a substitute for milk.

A new wine-cooling machine, F. T. Bioletti (*California Sta. Bul. 174, pp. 27, figs. 6*).—"The machine consists essentially of a copper tube 220 ft. long and 1¼ in. in diameter, through which the wine is pumped and which is inclosed in a canvas irrigating hose 4 in. in diameter, through which cold water runs in a direction opposite to that of the wine."

Preliminary tests with small models of this cooler are reported, as are also comparative tests of other cooling machines. It is thought possible that iron may be substituted for copper pipes, although this is not at present recommended, as tests have not been made on a practical scale. The leakage through the canvas hose permits the utilization of the cooling due to evaporation, which, under average working conditions in a dry climate, is estimated as equivalent to the use of water about 3° F. cooler in a machine where this evaporation could not take place.

Tests were made with water and must at different temperatures and with different ratios in the volumes of water and wine. One test of the new machine showed that 1,000 gal. of fermenting wine can be lowered from 95 to 78° in 1 hour by the use of 850 gal. of water at 71.5°. Specifications are given for the construction of a cooler of this type suitable for the use of a cellar making not more than 300,000 gal. of dry wine during a vintage of 30 days with directions for using the cooler in order to secure the greatest efficiency, the latter including formulas and tables for calculating the number of degrees the must or fermenting wine must be cooled and the number of hours the cooler must be used.

The manufacture of Samshu (Chinese spirit) from Sorghum vulgare, E. H. Wilson (*Gard. Chron., 3. ser., 39 (1906), No. 1005, pp. 194, 195*).—This is a brief account of the methods employed in North China and Manchuria in the manufacture of this distilled liquor from sorghum seed.

VETERINARY MEDICINE.

Handbook of pathogenic micro-organisms, W. KOLLE and A. WASSERMANN (*Handbuch der pathogenen Mikroorganismen. Jena: Gustav Fischer, 1906, Sup., pt. 1, pp. 384, pls. 7, figs. 27*).—This is the first supplemental volume to the large work published under the supervision of the editors and contains an account of trypanosomes, pyroplasmosis, tuberculosis of animals and man, bacterial hematoxins, amebic dysentery, leprosy, and typhoid fever. The latest literature relating to these topics is discussed in connection with bibliographies.

It appears from the review of the literature on tuberculosis that mammalian tubercle bacilli must be divided into 2 types, the human and bovine. It is possible to choose a dose so small that when bovine tubercle bacilli are used in inoculating experimental animals generalized tuberculosis results, while with a dose of the same size of human tubercle bacilli no infection takes place.

A treatise on the parasites and parasitic diseases of the domesticated animals, L. G. NEUMANN, trans. by G. FLEMING (*London: Ballière, Tindall & Cox, 1905, 2. ed., pp. XVI+697, figs. 365*).—The present edition has been revised and edited by J. MacQueen and contains as heretofore, but in a revised form, a detailed account of the parasites affecting domestic animals. These parasites are arranged according to the organs or parts affected as, for example, the skin, digestive apparatus, serous membranes, respiratory apparatus, circulatory apparatus, muscles, connective tissue, bones, nervous system, and genito-urinary organs. An elaborate bibliography of literature relating to this subject is appended to the volume (pp. 647–678).

Police sanitation of animals, A. CONTE (*Police sanitaire des animaux. Paris: J. B. Baillière & Sons, 1906, 2. ed., pp. XII+532*).—The government veterinary sanitation in France and her colonies is presented in great detail for the guidance of veterinarians who are concerned with this work.

In a preface to the volume E. Leclainche makes a number of suggestions regarding possible lines of improvement in existing laws. The volume as a whole is divided into three parts relating to veterinary sanitation of France, the colonies, and special information regarding the duties and functions of officials connected with the work.

An elaborate review of the development of the French veterinary laws is presented, together with a discussion of all general sanitary measures relating to the visitation of infected premises, declaration of infection, disinfection, indemnities, supervision of diseased animals, and the general practices of police sanitation.

Special chapters are also given on legislation relating to rabies, cattle plague, contagious pleuro-pneumonia, blackleg, tuberculosis, sheep pox, foot-and-mouth disease, glanders, dourine, swine erysipelas, hog cholera, etc.

Therapeutic technique, W. SCHLAMPP (*Therapeutische Technik. Stuttgart: F. Enke, 1906, vol. 1, pp. VII+419, figs. 171*).—In this part of the author's work on the technique of general therapy for veterinarians attention is given to a discussion of therapeutic measures applicable to the skin. The material which naturally falls under this head is classified according to the nature of the remedies used.

Special chapters are devoted to application to the skin of various fluids, salves, pastes, soaps, varnishes, plasters, powders, and paints. The methods of removing the hair are also discussed and an account is presented of treatment of the skin by means of surgical operations, subcutaneous inoculation, irritation of the skin, the use of blisters, and methods adopted for the protection of animals against various parasitic skin infections. The nature and use of a large number of drugs are carefully considered.

Experimental studies on the permeability of the walls of the alimentary tract of newborn animals for bacteria and proteids, A. GEESINK (*Arch. Hyg., 55 (1906), No. 1–2, pp. 1–139, pl. 1*).—The author conducted a long series of

experiments in feeding new-born animals with virulent cultures of anthrax and tuberculosis, as well as with certain proteids.

In all cases great care was exercised not to injure the mucous membrane in any way so that the infection which followed could be attributed to the permeability of the intestinal walls for the bacteria in question. The experimental animals were guinea pigs and rabbits. By means of tubes and pipettes it was found possible to measure in a very accurate manner the amounts of bacterial cultures fed to the animals. During these experiments it was found that the anthrax bacillus leaves the alimentary tract very readily.

Within 6 hours after feeding the feces contained anthrax bacilli in large numbers, while after 17½ hours they were to be found only in isolated cases. The anthrax bacillus, however, did not lose its virulence in passing through the alimentary tract. It was found that young guinea pigs could be fed very large quantities of virulent anthrax bacilli without causing any infection. Even spore-bearing cultures failed to be pathogenic. When these experiments were carried out according to the requirements of von Behring the guinea pigs remained in perfect health.

In experiments with tubercle bacilli the results were quite different. Within a few days after feeding large quantities of tubercle bacilli, some bacilli were found in the glands of the omentum and liver. When only small quantities were fed, however, the tubercle bacilli could not be found in the glands. Apparently the bacilli passed through the walls of the alimentary tract very rapidly. In certain stages of the process, especially in the cecum and vermiform appendix, sections were made of this material and examined microscopically. Notes are also given on the permeability of the intestines for hemolytic serum, casein, albumen from hens' eggs, and various antitoxins.

Bacillus necrophorus and its economic importance, J. R. Mohler and G. B. Morse (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 91, pp. 76–116*).—This is reprinted from the annual report of the Bureau for 1904 (E. S. R., 17, p. 702).

Report of the chief inspector of stock, R. E. Weir (*Jour. Dept. Agr. West. Aust., 13 (1905), No. 6, pp. 527–531*).—An account is given of the present government veterinary staff of Western Australia. Brief mention is also made of the prevalence of pleuro-pneumonia, tuberculosis, hog cholera, and Texas fever among animals as well as poisonous plants. The author discusses the present status of horse, cattle, and sheep raising and gives brief notes on the condition of pastures, abattoirs, and the registration of brands.

Books, memoirs, and articles on tuberculosis, Bouchez (*Rev. Tuberculose, 2. ser., 3 (1906), No. 1, pp. 98–120*).—A classified bibliography is presented of literature relating to tuberculosis in man and animals. The books and articles referred to are grouped under natural classes according to the organs affected by tuberculosis and into general groups—hygiene, pathology, therapeutics, experimental veterinary medicine, etc.

Cattle tuberculosis, H. Sessions (*New York: W. R. Jenkins, 1906, 2. ed., pp. VII + 120*).—This edition has been practically rewritten and brought up to date by the addition of much new material, particularly with reference to the recent discoveries relating to tuberculosis in cattle. The subject-matter in the volume includes an introduction and chapters on human tuberculosis as related to bovine tuberculosis, cause of the disease, symptoms and diagnosis, tuberculin test, milk inspection, meat inspection, disposal of tuberculous carcasses, and insurance of cattle intended for slaughter.

Danger of infection with tuberculosis by different kinds of exposure, E. C. Schroeder and W. E. Cotton (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 83, pp. 44–65*).—This is reprinted from the annual report of the Bureau for 1904 (E. S. R., 17, p. 699).

Danger from ingestion of tubercle bacilli killed by heat, A. CALMETTE and M. BRETON (*Presse Méd.* [*Paris*], *1906, No. 15, p. 115*).—Young guinea pigs were fed a single dose of 1 to 2 cg. of tubercle bacilli of bovine origin freshly dried and mixed with potato or carrots.

In all cases the guinea pigs died of generalized tuberculosis after about 92 days. Further experiments were then made with bacilli which had been heated to a temperature of 100° C. for a period of 5 minutes. In guinea pigs which were fed such material in doses of 1 to 2 cg. infection took place promptly and death occurred within 37 to 48 days. Hypertrophy of the renal capsules was observed and other lesions resembling those which occur in animals inoculated with repeated large doses of tuberculin. It appears, therefore, that tubercle bacilli killed by heat are not inert bodies for susceptible animals.

The infectiousness of milk and meat from tuberculous animals, H. PERICAUD (*Prog. Vét., n. ser., 26 (1906), No. 4, pp. 135–137*).—Attention is called to the fact that while bovine bacilli are doubtless very virulent for man they are seldom found in the meat of tuberculous animals. As a rule, therefore, such meat can be used without harm. Milk from tuberculous cows, however, must be considered as dangerous and should be sterilized in some manner before being used.

The frequency of tuberculosis in the dairies of Paris, H. MARTEL (*Rev. Soc. Sci. Hyg. Aliment., 2 (1905), No. 6, pp. 559–563*).—Attention has already been called by the health authorities of Paris to the prevalence of tuberculosis among herds which furnish milk for the city. A tuberculin test carried out on 628 cows gave a reaction in 215, or 34.2 per cent, of the animals. On account of this large percentage it is urged that the measures prescribed by the health authorities of Paris be carried out strictly and that further precautions be taken to avoid the subsequent contamination of stables by the introduction of tuberculous animals or otherwise.

The lymphocyte and tubercle bacillus, J. BARTEL and W. NEUMANN (*Centbl. Bakt.* [*etc.*], *1. Abt., Orig., 40 (1906), No. 4, pp. 518–537*).—It has usually been assumed that the lymphatic organs and glands must exercise more or less influence upon tubercle bacillus for the reason that this bacillus is carried to so large an extent throughout the organism in the lymphatic system and affects in so large a per cent of cases the lymphatic glands.

Notwithstanding the apparent logical basis for such an assumption the demonstration of any direct influence of the leucocytes upon the tubercle bacillus has proved a difficult matter and in the case of most investigations only negative results have been obtained. In the author's experiments this matter was tested in vitro by placing material from the lymphatic glands in cultures of tubercle bacilli. Such material after varying lengths of time was used for further inoculation of experimental animals.

When the substance of mesenteric glands was used in such tests it was found that animals inoculated with the mixture did not become infected with tuberculosis and showed no infiltration at the point of inoculation or changes in the corresponding lymphatic glands. The substance of the spleen and the lymphatic glands appears, therefore, to exercise an important influence in combining the toxins of tubercle bacillus in essentially the same manner described by Brieger, Kitasato, and others. Tubercle bacilli kept in contact with such material for 22 days were not capable of producing any reaction at the point of inoculation.

Tuberculosis of the spleen in guinea pigs, C. ACHARD and P. EMILE-WEIL (*Arch. Méd. Expt. et Anat. Path.* [*Paris*], *18 (1906), No. 1, pp. 71–84*).—A number of types of splenic lesions were observed in tuberculosis in the guinea pig. The ordinary splenic tuberculosis shows small granulations in the slightly congested parenchyma. In another type the tubercles fuse, causing a filtration of the organ. Hemorrhagic tuberculosis is also observed in some cases. In this type of the disease the spleen is much enlarged, weighing from 5 to 35 gm.

Experience with von Behring's method of protective vaccination of cattl against tuberculosis, SCHRICKER (*Wchnschr. Tierheilk. u. Viehzucht, 50 (1906), No. 7, pp. 121–128*).—Von Behring's method of vaccination against tuberculosis has beer in practical use for 3 years and the results obtained, therefore, give a good foundation for judging its effectiveness.

The author vaccinated 76 animals by this method without any bad effects, and or evidence of live tubercle bacilli were found in any of the animals which were subse quently killed and examined. It is concluded, therefore, that a protective vaccination of calves under 4 months of age is capable of greatly increasing the resisting power toward tuberculosis and in some cases checks slightly the development of an infection already existing at the time of vaccination.

The prevention of tuberculosis in cattle, J. WILSON (*Dept. Agr. and Tech. Instr. Ireland Jour., 6 (1906), No. 2, pp. 300–304*).—Tuberculosis in cattle according to the author is chiefly spread by means of the air and food. Notes are given on these different methods of infection and on the prevalence of tuberculosis in England. It is estimated that from 5 to 10 per cent of the yearlings in England are infected, 10 to 20 per cent of 2-year olds, and 40 to 60 per cent of adult cows. Attention is called to the danger from mammary tuberculosis in cows and to the use of tuberculin and other methods in the detection and eradication of the disease.

Anthrax, D. LAN (*Rev. Facult. Nac. Agron. y Vet., 2. ser., 1 (1905), No. 6, pp. 173–176*).—Veterinarians in various parts of South America are frequently called upon to deal with outbreaks of anthrax. The author presents a brief account of the course of the disease and of the usual methods of vaccination to immunize animals against it.

Immunization of the guinea pig and rabbit against anthrax, F. MARINO (*Compt. Rend. Soc. Biol. [Paris], 60 (1906), No. 6, pp. 306–308*).—In the author's experiments it was found possible to vaccinate guinea pigs against anthrax by means of subcutaneous injections of the first vaccine. It was very difficult to produce immunity, however, by intraperitoneal injections.

Guinea pigs which withstood repeated subcutaneous injections of a mixture of anthrax and preventive serum from a rabbit or guinea pig frequently failed to resist the minimum mortal dose of the first vaccine. The normal serum of rabbits mixed with virulent anthrax and injected hypodermically into guinea pigs protects them against the disease.

The pathological anatomy of glanders, SCHÜTZ (*Ztschr. Veterinärk., 18 (1906), No. 2, pp. 49–62*).—This statement was originally prepared in 1882, for the guidance of army veterinarians in determining cases of glanders and for use in diagnosing the disease from pathological material sent to the veterinary school in Berlin. The article in its present form has been recently revised and brought up to date.

Observations on normal and rinderpest blood, F. S. H. BALDREY (*Jour. Trop. Vet. Sci., 1 (1906), No. 1, pp. 47–69*).—In a study of the normal blood it is found that the average number of red blood corpuscles was 7,298,484 per cu. mm. The number varied, however, from 5,600,000 to 9,100,000 and the number of leucocytes varied from 8,000 to 18,000.

In arriving at these averages a large number of counts were made. An examination was also made of the blood of animals which had been bled for the production of a protective rinderpest serum. In these animals it was found that the average number of red blood corpuscles was 3,713,000 per cu. mm. In animals actually suffering from rinderpest the number of leucocytes increases rapidly, rising to 32,000 by the fourth day. The relative proportion of the various elements in the blood is discussed for other diseases as compared with rinderpest.

Redwater in cattle, A. E. METTAM (*Dept. Agr. and Tech. Instr. Ireland Jour., 6 (1906), No. 2, pp. 248–260, pls. 3*).—This disease, under various names, occurs in North and South America, Africa, Australia, various parts of Asia, and Europe. The

blood parasite which causes the disease is described and notes are given on the symptoms of redwater or Texas fever. A summary account is also given of some of the experimental work done in this country on this disease.

Cattle tick investigation, A. MAYER (*Proc. La. Agr. Soc. and Stockbreed. Assoc., 1905, pp. 103–110*).—Attention is called to the great economic importance of the cattle tick.

This pest not only stunts the development of cattle so that they fail to reach their normal size, but also reduces the market price of cattle raised below the quarantine line. On account of the fact that there are large tick-free areas below the quarantine line cattle raised on such areas must be inoculated or gradually infested with ticks in early life, otherwise they are as susceptible to Texas fever as northern cattle. Considerable reliance is placed in the use of good dips for destroying ticks, but attention is called to the desirability of systematic work in exterminating the tick.

The etiology of pneumonia, RIPS (*Berlin. Tierärztl. Wchnschr., 1906, No. 8, pp. 129, 130*).—Excellent opportunity was had for the study of this disease in horses. It appeared as an infectious disease without special localization in the lungs, and at the outbreak of the symptoms considerable catarrh was noted in the upper part of the respiratory passages, but this was much less pronounced than the catarrhal condition of the duodenum. The temperature rose on the second day to 40.5° C., but fell to normal again within 8 days.

The persistence of tetanus spores in the animal organism in a latent form, G. TAROZZI (*Centbl. Bakt. [etc.], 1. Abt., Orig., 40 (1906), Nos. 3, pp. 305–311; 4, pp. 451–458*).—Guinea pigs and rabbits were used in the experiments reported in this paper, being inoculated with virulent tetanus cultures which had been kept under aerobic conditions. Only 11 animals were used in the experiments for the purpose of determining whether and how long tetanus spores remain in a latent condition in inoculated animals.

It was found possible to demonstrate the spores in all cases in the liver, usually in the spleen, but, as a rule, not in the kidneys. The author considers that these experiments demonstrate that the tetanus spores pass into the general blood circulation from the point of inoculation and become located in various vital organs where they may persist in a virulent condition for a long period. When removed from such organs they are capable of producing very toxic cultures.

Infectious diarrhea of calves and liver disease of chickens, N. S. MAYO (*Estac. Cent. Agron. Cuba Circ. 22, pp. 4*).—Brief notes are given on the distribution of infectious diarrhea in calves together with notes on the rate of mortality and antiseptic treatment to be adopted in preventing the disease. For this purpose the author recommends creolin. A disease of fowls known as little liver is described. The disease is, however, not characterized by lesions in the liver, but by symptoms which closely resemble those of roup. In treating the disease the author recommends the use of potassium permanganate in water at the rate of 1 part to 60.

Diseases of the stomachs in ruminants, J. L. WEBB (*Natal Agr. Jour. and Min. Rec., 9 (1906), No. 1, pp. 1–7*).—Cattle are susceptible to various digestive troubles on account of their tendency to eat various indigestible or otherwise harmful substances. In this way hair balls are formed in the stomach and actual lesions may be produced as the result of eating bones or other materials with sharp points. An account is given of impaction of the omasum, gastritis, and parasitic irritation of the fourth stomach. In removing these parasitic worms the author recommends the use of a mixture of 2 oz. areca nut and 30 grains of arsenic made into 10 doses and given daily for a period of 6 days in bran.

Enzyms in cornstalks and their relation to cornstalk disease, T. M. PRICE (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 84, pp. 66–75*).—This is reprinted from the annual report of the Bureau for 1904 (E. S. R., 17, p. 702).

33747—No. 11—06——7

Observations on Bilharziosis among animals in India, R. E. MONTGOMERY (*Jour. Trop. Vet. Sci., 1 (1906), No. 1, pp. 15–46, pls. 2*).—The characters of the genus Bilharzia or Schistosomum are mentioned in some detail. The form which occurs commonly in cattle is *Schistosomum bovis.*

Particular attention is given in this article to bilharziosis in the horse. The author had opportunity to make a number of post-mortem examinations on affected horses in the plains and hill regions. In addition to the blood parasite which is described as new under the name *S. indicum*, various tapeworms, flukes, and roundworms were found as well as bots. Many of the cases under observation were complicated with surra. The abdominal cavity was found to be in a state of general congestion, as well as the liver and pancreas. The intestinal tract is also the seat of various pathological lesions. The blood parasite may best be obtained from the portal vein of the liver.

A brief bibliography relating to blood parasites in the horse and ass is appended to the article.

Prevention of sheep pox, D. D. GARCIA (*Gac. Med. Zool., 30 (1906), No. 4, pp. 51–54*).—On account of the wide distribution of this disease the importance of practical methods for its control is quite evident. The author calls attention to the use of a preventive and curative serum against sheep pox.

Dipping as a means of preventing ovine diseases, F. A. VERNEY (*Natal Agr. Jour. and Min. Rec., 9 (1906), No. 1, pp. 11, 12*).—Since *Amblyomma hebræum* is the species of tick which is concerned in carrying heartwater, it is recommended that sheep be dipped for the destruction of this tick in order to control the disease.

Sheep botfly, E. THIERRY (*Jour. Agr. Prat., n. ser., 10 (1905), No. 37, pp. 344, 345, fig. 1*).—The appearance and distribution of this insect are briefly outlined. No curative nor preventive remedies are known which are practical and effective. The palliative measures usually recommended are briefly discussed.

Some common parasites of sheep (*Dept. Agr. and Tech. Instr. Ireland Jour., 6 (1906), No. 2, pp. 295–299, pls. 2*).—A discussion is presented of scab mite, sheep ticks, nostril fly, sheep maggots, and biting lice, remedies being recommended for the control of each one of these troubles.

The life history of the twisted wireworms (Hæmonchus contortus) of sheep and other ruminants, B. H. RANSOM (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 93, pp. 7, figs. 2*).—The common stomach worm of sheep is described in its various stages and particular attention is given to a summary of its life history.

It appears that the sheathed embryos of this parasite on grass in infested pastures are capable of great resistance toward cold and desiccation. It is evident, therefore, that the parasite is not destroyed in pastures by the cold weather of winter. The life history of this worm is comparatively simple. The eggs in the feces of infested animals hatch and the young crawl up the stems of grass where they become covered with the sheath and are later taken into the stomach of sheep in grazing. Feeding experiments were carried out which showed that the worm is in a condition to develop in the stomach of sheep when eaten along with grass.

The best method of cleaning up infested pastures consists in burning the grass. It is quite uncertain how long a time must be allowed for the starvation of the embryos and vermifuges can not be depended upon to expel the worms entirely from infested sheep. Experiments are in progress to test the method of raising lambs free from infection.

Swine plague, SCHMIDT (*Berlin. Tierärztl. Wchnschr., 1905, No. 51, pp. 865–869*).—This is a controversial article in which attention is called to the more or less incompatible claims made by various investigators and to the recent discoveries made by the Bureau of Animal Industry in regard to a form of hog cholera caused by a filterable virus. An editorial note is appended to the article in which it is stated that

the subject of swine diseases was not discussed so thoroughly at the recent international veterinary congress as the diseases of other animals.

The immunization against swine plague by means of bacterial extracts, J. Citron (*Ztschr. Hyg. u. Infectionskrank., 52 (1906), No. 2, pp. 238–262*).—During a long series of experiments it was clearly shown that it is possible by means of a serum obtained from actively immunized rabbits to protect other rabbits, guinea pigs, and white mice against doses of bacteria many times the fatal size. The serum of normal rabbits in smaller quantities did not increase the resisting power of animals into which it was inoculated. The author believes, therefore, that the existence of specific complements in the blood is shown beyond question.

Through what agency is the Trypanosoma evansi carried over from one surra season to another? A. Lingard (*Jour. Trop. Vet. Sci., 1 (1906), No. 1, pp. 92–112*).—Surra is usually fatal in horses, asses, mules, camels, goats, sheep, rats, dogs, and buffaloes. In cattle, however, both in the plains and hill breed, the disease when uncomplicated frequently terminates in recovery.

Cattle may carry the blood parasite for long periods, at least exceeding a year, and are, therefore, the only domestic animals found by the author to be capable of resisting spontaneous inoculation with trypanosomiasis. It is important, therefore, to determine whether cattle affected with this chronic form of the disease are agents in its transmission. As a result of the author's investigations it was found that the blood of cattle affected with the chronic form of the disease, when inoculated into susceptible horses, causes fatal cases of trypanosomiasis, and from such cases the rapid dissemination of the disease may occur.

Camels may also carry the disease for from 9 to 12 months and their blood is likewise pathogenic for horses. It is also found that dogs and cats are susceptible to the disease carried by camels. It is probable, although not definitely demonstrated, that various other wild carnivorous animals may be the agents in carrying the disease. The most rational system of controlling the disease, in the author's opinion, consists in the destruction of all affected horses in which the disease occurs in a virulent form.

Tibarsa surra, H. T. Pease (*Jour. Trop. Vet. Sci., 1 (1906), No. 1, pp. 70–91*).—Camels have long been known to be susceptible to surra and considerable attention has been given to a study of this disease, with particular reference to its relation to other similar blood diseases. As a result of the author's investigations it is concluded that the form of surra which occurs in camels is due to *Trypanosoma evansi*, the same species which occurs in horses. The disease is often found affecting camels, horses, and mules in the same locality and is apparently due to the same cause.

A specific serum for Trypanosoma brucei and its effect upon T. gambiense, F. K. Kleine and B. Möllers (*Ztschr. Hyg. u. Infectionskrank., 52 (1906), No. 2, pp. 229–237*).—A serum was obtained from asses infected with *T. brucei*, which protected mice against fatal doses of this organism. It was observed, however, that the serum did not protect the animal from which it was obtained. Actively immunized trypanosomes inoculated into normal animals soon lost their immunizing property, so that a specific serum was found to be more active in the case of such animals. The serum showed considerable difference in its effect upon *T. brucei* and *T. gambiense*.

The action of brilliant green on the trypanosomes of nagana, H. Wendelstadt and T. Fellmer (*Ztschr. Hyg. u. Infectionskrank., 52 (1906), No. 2, pp. 263–281, pl. 1*).—Brilliant green was administered subcutaneously in doses of 1 cc. in solution in the proportion of 1:200.

It was found that when experimental animals were thus treated the trypanosomes in the blood were soon affected to such an extent that they would not cause infection when inoculated into another animal. In the course of time brilliant green causes the entire disappearance of trypanosomes in the blood of rats, monkeys, and other experimental animals. The addition of small quantities of arsenic increases

this action. In the process of disintegration of trypanosomes in the blood under the influence of brilliant green a number of peculiar developmental forms were observed.

Piroplasmoses, L. PANISSET (*Rev. Gén. Méd. Vét., 7 (1906), No. 75, pp. 113–127, fig. 1*).—The distribution of these diseases throughout the world is briefly outlined, and descriptive notes are given on piroplasmoses in sheep, horses, and dogs, with an account of the symptoms and lesions in each case, etiology of the various forms of the disease, the agency of ticks in transmitting the disease, and immunization by means of vaccine and serum.

Piroplasmosis complicated with horse sickness, THEILER (*Rev. Gén. Méd. Vét., 7 (1906), No. 76, pp. 178–181*).—Brief notes are given on the occurrence of piroplasmosis among horses after inoculation with the virus of horse sickness. The development of piroplasmosis was due to the use of infected blood.

The treatment of nail pricks of the horse's foot, E. L. MOORE (*South Dakota Sta. Bul. 95, pp. 17–22*).—Attention is called to the fact that even slight injuries to the foot may develop serious complications on account of the fact that the foot is constantly in contact with the dirt which may carry bacteria.

In treating cases of nail pricks, followed by the formation of pus, the author obtained excellent results by cleansing the hoof with soap and water, paring away the horn of the hoof from around the affected part, then washing the part in a solution of corrosive sublimate, after which a piece of absorbent cotton is placed on the hoof and the whole firmly bandaged and covered with a thick coating of tar. A little cotton is allowed to extend above the tar bandage, and the corrosive sublimate solution may be applied daily without removing the bandage. This bandage should be left in place for from 7 to 10 days without being disturbed. Detailed clinical notes are given on a number of cases.

Poisoning of horses by Ornithogalum thyrsoides, D. HUTCHEON (*Agr. Jour. Cape Good Hope, 28 (1906), No. 2, pp. 165–172, pl. 1*).—A report was previously made on the death of horses from eating this plant and experiments were made in feeding dried plants which proved to be exceedingly poisonous. Further experiments were carried out in feeding the fresh green plant, and these experiments furnished the basis for the present article. It was found that two pounds of the fresh plant were sufficient to cause death in ponies within 2 days. The symptoms of poisoning are briefly discussed and notes are given on the distribution of the plant.

Examination of the Western Australian poison plants, E. A. MANN (*Jour. Dept. Agr. West. Aust., 12 (1905), No. 6, pp. 550–561, pls. 5*).—Chemical analyses were made of various poisonous plants, including *Gastrolobium calycinum* and other species of this genus, as well as species of Oxylobium, particular attention being given to the first-named species. An alkaloid known as cygnin was isolated and was used in physiological tests with guinea pigs. It was found that this alkaloid was fatal for ordinary guinea pigs in hypodermic doses of $\frac{1}{10}$ to $\frac{1}{20}$ of a grain.

The rabies corpuscles of Negri, J. SCHIFFMANN (*Ztschr. Hyg. u. Infectionskrank., 52 (1906), No. 2, pp. 199–228*).—As the result of an extensive study of these bodies the author found that at times they may not be present in the medulla or spinal cord. They are subject to considerable variation with regard to their structure, distribution, and occurrence in the hippocampus and cerebellum, but this variation is independent of the incubation period and number of inoculations which have been made with the virus. After repeated passages of the virus Negri's corpuscles may be entirely absent in the hippocampus and cerebellum.

The tapeworms of American chickens and turkeys, B. H. RANSOM (*U. S. Dept. Agr., Bur. Anim. Indus. Circ. 85, pp. 268–285, figs. 31*).—This is reprinted from the annual report of the Bureau for 1904 (E. S. R., 17, p. 704).

RURAL ENGINEERING.

Irrigation investigations (*Kansas Sta. Rpt. 1905, pp. 26–41*).—This gives the results of investigations of irrigation at Fort Hays and Garden City, Kansas, carried on in cooperation between the Kansas Station and this Office. An account of this work was also given in Bulletin 158 of this Office (E. S. R., 17, p. 705).

Report of the reconnaissance of the Vaal River, F. A. HURLEY (*Pretoria: Transvaal Irrig. and Water Supply Dept., 1905, pp. XV+76, pls. 26*).—This report contains "preliminary descriptions and approximate estimates of the most favorable irrigation schemes practicable" from Vaal River in South Africa, a stream with an annual discharge of about 2,500,000 acre-ft., of which about 65 per cent passes during March floods.

Six projects are included, the two most urgently recommended irrigating 11,800 acres in the Transvaal and 27,800 acres in Orange River Colony. The third and fourth projects would irrigate 60,000 and 20,000 acres, respectively, while the fifth, which would involve an expenditure of about $25,000,000, would irrigate 400,000 acres, an undertaking not to be considered at present. The sixth project involves only Cape Colony land and is an expensive storage project not fully worked out as yet. The estimated costs per acre runs as follows: $77, $63, $76, $96, $50–60, and $112.

The annual water rate assumed is $5 to $7.50 per acre, and the increment in value of land $50 to $75 per acre. Maintenance charges are assumed to be about one-fifth of the water rentals, and the net return on the entire investment is estimated as about 6 per cent, except in the sixth project, where it is but 3.3 per cent. If the total increase in value of the land is deducted from the cost of the projects the estimated earnings run 126, 24, 14, 31, and 6 per cent, the fifth project not being included.

The duty of water is estimated on the basis of the severest possible system of cropping with a 3-year rotation of wheat, tobacco, vetches and rye, potatoes, beets and roots, vetches and rye, tobacco, and potatoes. It is further supposed that each irrigation will be 4 in. in depth and that in all 17 irrigations will be required in 3 years, the time of sowing and rainfall being considered. Allowing for 60 per cent loss, 1,000,000 cu. ft. of water must be stored annually for each 5 acres, or about 150 acres per cubic foot per second for a 9-months' season, allowing 20 per cent for roads and waste land. In order to meet the possible requirement of a 4-in. irrigation of the whole area in one month, the estimates for canals are on the basis of 100 acres per cubic foot per second. These estimates are reasonable when compared with the usual duty of 100 acres per cubic foot per second in Egypt, 100 to 300 in India, 120 and 150 under two California canals, and 150 in Spain and Italy.

In reviewing the subject of water rates the author cites as examples tracts in Cape Colony where land and water rent for $20 to $22 per acre, while in India the rate is about one-tenth and in Egypt one-seventh of the gross value of crops produced. Regarding the Reclamation-Act projects in the United States he says: "It would seem that the rates have been pitched very low to attract settlers." The rate assumed on the Vaal of $5 per acre is believed to be less than one-tenth the value of a crop of wheat and corn, the least valuable crops likely to be grown. The total cost to the renter, assuming 6 per cent interest on the value of the land, is considered reasonable, since it falls under $12.50 per acre annually.

A note by the director of irrigation, W. L. Strange, is included, in which it is stated that $15,000,000 in produce was imported into the Transvaal in 1904, showing a good market for irrigated products. He points out that the financial failure of irrigation works has usually been due to slow settlement, and that hence large works should be built by the State, which can afford to wait for returns in the form of general prosperity, and that the development of irrigation works should not outrun the normal settlement of the country.

Agriculture in the valley of the Ahr, H. Dupays and L. Lebrun (*Jour. Agr. Prat., n. ser., 11 (1906), No. 8, pp. 241–248, figs. 5*).—This article describes briefly irrigation practice in the valley of the Ahr. The irrigation works are simple. The ditches are usually made with rectangular cross section in order that they may take up no more room than is necessary. Water is carried in rectangular flumes made of galvanized iron supported on I-beams. The water is used on meadows, the charges for water being 20 marks per hectare per year.

Pumping machinery at Mildura (*Impl. and Mach. Rev., 31 (1906), No. 372, p. 1406*).—At Mildura, Victoria, water is pumped for 8,000 acres of land. The water is raised at three separate lifts, 20, 25, and 25 ft. Water is pumped at the rate of 26,000 gal. per minute. As a rule there are five irrigations during the year, each lasting 28 days, and the pumps are run at a cost of $300 per day, or about $42,000 per year. The fuel is wood. The costs are met by a water tax which varies from 30 to 40 shillings per acre for the land covered. The land receives an average depth of about 22 in. per annum.

A Hawaiian pumping plant for irrigation (*Engin. Rec., 53 (1906), No. 10, p. 350*).—A description of a plant utilizing a small mountain stream by means of impulse wheels and an electric power plant. A method for regulating the speed of the dynamo, motor, and pump has been adopted so that the efficiency is not impaired when the supply in the hills is short. Larger impulse wheels are then used, giving a slower speed to the generator. With an automatic device to keep the field constant the voltage and cycles are diminished in proportion, the motor then falling off in speed without decreased efficiency.

Canals and ditches, M. Ringelmann (*Jour. Agr. Prat., n. ser., 11 (1906), No. 7, pp. 210–212, figs. 8*).—This article summarizes foreign and American measurements of percolation of water from ditches, and discusses methods of prevention of losses in canals used for carrying water. It describes methods of preventing seepage losses, including concrete lining, masonry lining of ditches with rectangular cross sections, and the use of flumes.

The Belle Fourche dam, Belle Fourche project, South Dakota, R. F. Walter (*Engin. Rec., 53 (1906), No. 9, pp. 307–310, figs. 7*).—This dam is one of the largest earth dams in the United States, being over a mile in length and containing 1,600,000 cu. yds. The details of the wasteway, conduits, and gates are described in detail. An unusual feature is the proposed concrete-block facing laid over gravel in lieu of riprap.

The Belle Fourche irrigation works, South Dakota, W. W. Patch (*Engin. News, 55 (1906), No. 8, pp. 210–212, figs. 5*).—A brief account of the project, with a description of the more important structures used.

The drainage of earth roads (*Engin. Rec., 53 (1906), No. 18, pp. 564–566*).—This is an abstract of a bulletin on this subject by Prof. Ira O. Baker, published by the University of Illinois.

It is recommended that tile drains be laid at the side of the road at a depth of 3 or 4 ft., such a drain on one side of an ordinary country road being held to be sufficient. The drain might be more effective in the middle of the road, but the expense of putting it in would be so much greater that a drain at the side of the road is preferred. There is no limit to the steepness of the grades on which tile drains may be used, but the grade should not be less than 2 in. per 100 ft. It is important that the tile drains should have a free outlet. The cost of putting in 5-in. tile drains is given as $200 to $250 per mile.

Side ditches are necessary whether the tile is used or not. These should be broad rather than deep, with easy slope toward the road in order that vehicles may not be harmed if they get into these ditches. Water should not be carried long distances in these side ditches, but outlets should be provided at short intervals. Roads should be crowned sufficiently to provide for rapid surface drainage into the side ditches.

Where the roads are in excavation catch waters should be provided to keep drainage water off of the road. For maintaining the surface of roads in good condition, harrowing or dragging with a railroad rail, heavy timber, or split log is recommended.

The mixing of concrete, E. McCULLOUGH (*Sci. Amer. Sup., 61 (1906), No. 1580, pp. 25316–25318*).—The author states briefly the advantages of concrete over stone, calls attention to the necessity of thorough mixing, and compares hand mixing with various types of mechanical mixers. He favors the cube mixer.

Report of the commission on alcohol appointed by the minister of finance (*Jour. Agr. Prat., n. ser., 11 (1906), No. 15, pp. 454, 455*).—This commission, appointed to inquire into proper legislation for controlling the manufacture and sale of alcohol, recommended in regard to denaturized alcohol that: (1) In order to avoid adulteration the dealers should be required to label their goods in a conspicuous manner "denaturized alcohol, guaranteed 90 degrees;" (2) denaturized alcohol should have the benefits of reduced rates of transportation granted to refined petroleum; (3) that the vessels for denaturized alcohol which are returned empty to the shipper should be carried free on the state railroads, or pay the rates charged for merchandise of the fourth or fifth class on private lines; (4) so far as possible the formalities observed in the distribution, storage, and sale of denaturized alcohol should be simplified.

MISCELLANEOUS.

Sixteenth Annual Report of Arizona Station, 1905 (*Arizona Sta. Rpt. 1905, pp. 26*).—This contains the organization list of the station, a review of the work of the station during the year by the director, a financial statement for the fiscal year ended June 30, 1905, and departmental reports, some of which are noted elsewhere.

Annual Report of Idaho Station, 1905 (*Idaho Sta. Rpt. 1905, pp. 48*).—This includes a financial statement for the fiscal year ended June 30, 1905, a report of the director on the work and publications of the station during the year, and experimental work and meteorological observations abstracted elsewhere in this issue.

Eighteenth Annual Report of Indiana Station, 1905 (*Indiana Sta. Rpt. 1905, pp. 46*).—This consists of the report of the director and heads of departments, a list of periodicals received by the station library, a subject list of the bulletins of the station to date, and a financial statement for the fiscal year ended June 30, 1905. The report of the director contains a list of the cooperative experiments in progress July 1, 1905, and the report of the chemist an analysis of a sample of cattle food which was found to contain 96.73 per cent of sodium chlorid. The report of the horticulturist is noted elsewhere.

Eighteenth Annual Report of Kansas Station, 1905 (*Kansas Sta. Rpt. 1905, pp. 55*).—This contains a financial statement for the fiscal year ended June 30, 1905, a report of the council including abstracts of bulletins issued during the year, brief summaries of the work of the different departments not reported upon in bulletins, a report on the work of Fort Hays Branch Station, a statement concerning cooperative experiments with this Department, a subject list of station publications issued to date, and an index to the report and the bulletins issued during the year.

Fourteenth Annual Report of Kentucky Station, 1901 (*Kentucky Sta. Rpt. 1901, pp. XV + 308*).—This report, only recently issued, contains a financial statement for the fiscal year ended June 30, 1901, brief reports of the director and heads of departments for that year, miscellaneous chemical analyses and meteorological observations noted elsewhere, and reprints of Bulletins 91–97 of the station on the following subjects: Enemies of cucumbers and related plants (E. S. R., 13, p. 368); experiments with potato scab (E. S. R., 13, p. 360); the food of the toad (E. S. R., 13, p. 325); grapes (E. S. R., 13, p. 355); diseases of nursery stock (E. S. R., 13, p. 571); rabbits and their injuries to young trees (E. S. R., 13, p. 531); wheat (E. S. R., 13, p. 737); commercial fertilizers (E. S. R., 13, p. 730); the Hessian fly (E. S. R.,

13, p. 968); dangerous mosquitoes in Kentucky (E. S. R., 13, p. 971); poisonous and edible mushrooms (E. S. R., 13, p. 920), and commercial fertilizers (E. S. R., 13, p. 935).

Fifteenth Annual Report of Kentucky Station, 1902 (*Kentucky Sta. Rpt. 1902, pp. XVI+349*).—This contains a financial statement for the fiscal year ended June 30, 1902, a report of the director on the work of the station, including the fertilizer and food-control work, miscellaneous chemical analyses and meteorological observations noted elsewhere, and reprints of Bulletins 98–104 of the station on the following subjects: Kentucky forage plants (E. S. R., 14, p. 241); experiments with oats (E. S. R., 14, p. 242); inspection and analyses of foods (E. S. R., 14, p. 277); a comparison of feeds for pigs (E. S. R., 14, p. 283); analyses of commercial fertilizers (E. S. R., 14, p. 558); Hessian fly experiments (E. S. R., 14, p. 987), and analyses of commercial fertilizers (E. S. R., 14, p. 953).

Eighteenth Annual Report of Louisiana Stations, 1905 (*Louisiana Stas. Rpt. 1905, pp. 32*).—This contains reports of the Sugar Station at Audubon Park, New Orleans, the State Station at Baton Rouge, and the North Louisiana Station at Calhoun; statements concerning the work of the State geological survey and the United States Geological Survey in the State, and a financial statement for the fiscal year ended June 30, 1905.

Finances, meteorology, index (*Maine Sta. Bul. 124, pp. 227–268+VII*).—This bulletin consists of meteorological observations noted elsewhere, a financial statement for the fiscal year ended June 30, 1905, an index to the station reports for 1901–1905 and to bulletins 112–124, which collectively make up the twenty-first annual report of the station, and announcements and notes concerning the station.

Eighteenth Annual Report of Michigan Station, 1905 (*Michigan Sta. Rpt. 1905, pp. 81–539*).—This contains a financial statement for the fiscal year ended June 30, 1905; reports of the director and heads of departments, summarizing briefly some of the results of experiment station work during the year; meteorological observations noted elsewhere; and reprints of Bulletins 217–231 and Special Bulletins 24–33 of the station, which have already been noted.

Report of work at McNeill Branch Station, 1904, E. B. Ferris (*Mississippi Sta. Bul. 87, pp. 16*).—Brief notes are given on weather conditions during the year and experiments with fruits, vegetables, and field crops are reported. The experimental work is abstracted elsewhere in this issue.

Eighteenth Annual Report of Vermont Station, 1905 (*Vermont Sta. Rpt. 1905, pp. 245–466*).—This includes the organization list of the station, a brief announcement concerning the station, a financial statement for the fiscal year ended June 30, 1905, a report of the director, abstracts of Bulletins 109–116 of the station issued during the year, and numerous articles abstracted elsewhere in this issue.

Abstract of Eighteenth Annual Report, 1905 (*Vermont Sta. Bul. 119, pp. 19–64, fig. 1*).—This is a résumé of the annual report of the station noted above.

Crop Reporter (*U. S. Dept. Agr., Bur. Statis. Crop Reporter, vol. 7, Nos. 11, pp. 95–102; 12, pp. 103–110*).—These numbers contain the usual statistics on the condition of crops in the United States and foreign countries and special articles on imported tobacco, exports of butter, imports of agricultural products into the United Kingdom, damage to the Cuban tobacco crop, the British market for Indian corn, and other topics.

Experiment Station Work, XXXIV (*U. S. Dept. Agr., Farmers' Bul. 251, pp. 32, fig. 1*).—This number contains articles on the following subjects: American sugar-beet seed, stimulants for seeds, profits from spraying potatoes, winter-injured fruit trees, durum wheat, fertility of eggs, indoor *v.* outdoor feeding of steers, roughage for steers, cheap dairy rations, and cotton-seed meal for hogs.

NOTES.

Colorado College.—A short course in horticulture was provided for by the State board of agriculture at its last meeting, to be held at Delta some time during the coming winter. This was done with the understanding that there would be at least fifty students regularly enrolled. One hundred have already signed the enrollment.

Delaware Station.—At a recent meeting of the board of trustees A. T. Neale was relieved of duty as director of the station, and was appointed in charge of the departments of agronomy and animal husbandry. This change went into effect July 1. A successor to Dr. Neale as director has not yet been elected.

Georgia Station.—Under the provisions of the Adams Act, the station proposes to inaugurate two new departments, i. e., departments of plant breeding and pathology (R. J. H. De Loach, of Athens, Ga., in charge), and of bacteriology. J. F. Monroe, of Guelph, Ontario, and P. N. Flint, of Cement City, Mich., have been made assistants in the departments of horticulture and animal industry, respectively.

Idaho University and Station.—Work is in progress on the new agricultural building, which is to be a brick structure 65 by 125 ft. in size and 3 stories high. The building will afford accommodations for the agricultural work of the university as well as the experiment station.

The people of Caldwell have donated 320 acres of land for an "auxiliary station," where experiments may be carried on under irrigation and dry-land farming.

Illinois University and Station.—The agricultural building at the university is undergoing an overhauling to secure space made necessary by the unexpected increase in students and by the demands of the station. The dairy department is now occupying the rooms made vacant by the removal of the household science department to the woman's building; the stock-judging room is being floored to provide an additional class room, and laboratories throughout the building are to be doubled in size.

A farm mechanics building, 100 ft. square and 2 stories high, is being erected. This will enable the entire southeast wing, which has been used for the farm mechanics work, to be fitted up for soil physics and crop work. When the agricultural building was erected there were but 19 students in agriculture and 7 instructors and investigators. Now the students have increased to 430, and there are 44 employees in the college and station—all within the space of 6 years.

Louisiana University and Stations.—E. Rosenthal, from the agricultural college, Madison, Wis., has been elected dairyman of the station at Calhoun. J. G. Lee, jr., of the class of 1906 of the university, has been placed in charge of feeding experiments at the station at Calhoun. H. R. Fulton has been elected to the position of plant pathologist at the station at Baton Rouge. Mr. Fulton is a graduate of the University of Mississippi, took his master's degree at Columbia, Mo., and has been taking work at Harvard the past year. H. J. Milk, of Watertown, N. J., has been elected bacteriologist of the stations, and will devote his time to the investigation of animal diseases.

The legislature passed a bill giving $50,000 for a new chemical laboratory for the university. The foundation is now being laid for a building to be devoted to experimental engineering.

Missouri Station.—Leonard Haseman, recently connected with the Florida University and Station, has been appointed assistant in entomology. C. R. Crosby, assistant in entomology, has gone to the New York Cornell Station.

Cornell University and Station.—T. L. Lyon, of the Nebraska University and Station, has been appointed agronomist in the station. W. A. Stocking, jr., for several years past connected with the Connecticut College and Storrs Station, has been elected assistant professor of dairy bacteriology in the college of agriculture.

The next winter dairy course at the university will open Thursday, December 6, and close Wednesday, February 27, 1907. This is about four weeks earlier than the course has been started heretofore. The change is made possible by the new dairy building and increased number of instructors for next year, which will permit both the long and short courses to be in progress at the same time. Nine-tenths of last year's class expressed themselves in favor of the earlier date.

Oklahoma College and Station.—At a recent meeting of the board of regents, A. T. Kruse, of Geary, Okla., appointed to succeed H. G. Beard, resigned, was elected treasurer of the board. E. H. Riley was relieved of station work to give all of his time to the school of agriculture and domestic economy. Roy C. Potts, a graduate of the Michigan Agricultural College, was appointed assistant in dairying in the college and station, vice C. H. Tourgee.

Texas College and Station.—John A. Craig resigned his position as dean and director July 1, and will give his attention to stock raising.

Vermont University and Station.—N. J. Giddings, a graduate in the agricultural department of the class of 1906, has been elected assistant botanist in the station to succeed W. J. Morse, who, as previously noted, resigned to accept a position at the Maine Station. H. A. Edson, a graduate of the chemical department of the class of 1906, assumes some of Professor Morse's college duties, and incidentally does some work for the station along botanical lines.

Virginia Station.—A large experimental orchard of dwarf apple trees on Doucin stocks was planted the past spring to determine the value of dwarf trees for commercial work. This orchard contains representatives of all the leading commercial varieties. This is the first orchard of its kind in the South, and the outcome is awaited with interest. The value of dwarf trees in relation to the horticultural operations of pruning, spraying, and harvesting is obvious, but questions of yield and hardiness in this climate are unsettled.

Extensive cooperative investigations relative to tobacco have been arranged for between the Bureau of Soils of this Department and the station. B. G. Anderson and W. L. Owen, graduates of the college of agriculture, have been appointed as the station's representatives to take charge of the cooperative work in the dark-tobacco belt at West Appomattox and in the light-tobacco belt at Chatham.

U. S. Department of Agriculture.—Dr. C. F. Langworthy, who has long been associated with the nutrition investigations assigned to this Office, formerly directed by Prof. W. O. Atwater, has been given general charge of this work, under the supervision of the director of the Office.

Dr. Ulysses G. Houck has been selected to have immediate charge of the new meat inspection work in the Bureau of Animal Industry. Dr. Houck was formerly a traveling inspector in the field. He will hereafter be located in Washington.

Dr. R. P. Steddom, chief of the Inspection Division of the Bureau of Animal Industry, will have immediate charge of the work on tick eradication provided for in the new appropriation act, and of the field work on the eradication of scabies in sheep and cattle.

Dr. Charles A. Browne, jr., recently chemist at the Louisiana Sugar Station at New Orleans, has been appointed chief of the sugar laboratory in the Bureau of Chemistry, this Department. He entered upon his duties early in July.

A. J. Pieters, in charge of the seed and plant introduction in the Bureau of Plant Industry of this Department, has announced his intention of resigning from the Department service in the early fall to engage in private business.

Cooperative Experiment Association of the Great Plains Area.—The first annual meeting of the Cooperative Experiment Association of the Great Plains Area was held at Lincoln, Nebraska, June 21–22, 1906. This association consists of those members of experiment stations who are interested in field-crop work in the States of North Dakota, South Dakota, Nebraska, Oklahoma, and the north of Texas, together with representatives of the Bureau of Plant Industry of this Department who are interested in experiments in crop rotation and tillage in that region. The association was organized at the time of the annual convention of the Association of American Agricultural Colleges and Experiment Stations at Washington in 1905, with B. T. Galloway as president and E. C. Chilcott as secretary.

This first annual meeting at Lincoln was a very successful one, both in point of attendance and the interest and enthusiasm manifested. Eleven members of the Department of Agriculture were present and about fifteen experiment workers. The following were among the papers read: Effect of Crop Rotation on Soil Fertility, J. H. Shepperd, North Dakota; Comparative Value of Corn and Summer Fallow in Alternation of Wheat, John S. Cole, South Dakota; Drought Resistance of Sorghum Crops, A. H. Leidigh, Bureau of Plant Industry, Amarillo, Texas; Seed Selection Essential in Crop Production under Semiarid Conditions, W. H. Olin, Colorado; Proposed Physical Investigations in connection with the Cooperative Cultivation Experiments, L. J. Briggs, Bureau of Plant Industry; Crop Production in Western Kansas, O. H. Elling, Fort Hays, Kansas. These papers and many other subjects of similar nature were informally discussed.

The visiting members were given an opportunity of seeing the work of the Nebraska Station, and a luncheon was tendered them by the Lincoln Commercial Club. Director E. A. Burnett was elected president for the ensuing year, and E. C. Chilcott, reelected secretary. Manhattan, Kansas, was chosen as the place of holding the next summer meeting.

Society for Horticultural Science.—At the Cornell meeting of the society, June 27 and 28, W. T. Macoun spoke on The Relation of Winter Apples to Hardiness of the Tree. To withstand a test winter at Ottawa, a tree or shrub must ripen its wood early. Winterkilling is liable to be more severe after a season when the growth has been strong than when it has been short. The more moderate the climate where a variety originates, the less resistant is it to winterkilling. The hardiest varieties of apples are those that have originated in Russia and are summer or autumn varieties. This is because they ripen their wood most thoroughly, whereas winter varieties continue growth later in the season. The basis for the production of the desired winter apple for the North should be a variety which has withstood test winters in a similar climate and is also the latest keeper of such varieties.

William Stuart presented a general discussion of the use of anesthetics in the forcing of plants, and summarized his own experiments with rhubarb. (See E. S. R., 17, p. 250.)

In a paper on Pollination Methods, S. W. Fletcher presented a symposium of his own experience and that of a considerable number of other plant breeders. The ideal time to emasculate blossoms is as late as possible before the anthers dehisce, but may be done when the buds are still quite small. If complete accuracy is not essential, and when working on blossoms that do not mature stamens and pistils simultaneously, the blossoms need not be emasculated. In crossing, select mature trees of moderate growth and perfectly sound. On such trees select buds borne high up on the outside of the tree on well-nourished branches on the side of the tree opposite from the direction of severe prevailing winds. As to the instruments for emasculating, in the majority of cases a small scalpel is to be preferred, especially for the stone and pome fruits. As to the location of the cut, the majority opinion is that it should be made at the insertion of the stamens above the nectary, though the author

himself prefers to make it as high up as possible. The safest time to pollinate is near the beginning of the receptive condition of the pistils or perhaps twenty-four hours before. A receptive stigma usually glistens when it catches the sunlight and in most fruits it is beginning to be slightly brownish. Brush pollinating is often most practicable when many blossoms must be pollinated in a short time. For our common trees, however, some workers use the thumb or forefinger. As to the percentage of successes, seven pollinators of experience placed their averages variously at from 50 per cent down.

Some phases of pollination were presented by N. O. Booth. The period during which fresh pollen is available for study may be lengthened by forcing twigs in the laboratory. If pollen is taken from the orchard at the normal blooming season it is advisable to take twigs with still unopened buds and let them open indoors. This assures freedom from foreign pollen. Very few apple varieties have the pollen all good and none so far all bad, most varieties showing different proportions of mixed forms. Pollen from the same tree may differ with the condition of the tree. Tompkins King and Esopus Spitzenburg among others have notably weak pollen and are successfully raised only in neighborhoods where conditions are favorable for pollen production. Varieties with particularly strong pollen, as Jonathan and Ralls, are of wide adaptation and are often liable to overbear, the fruits being consequently undersize.

F. W. Card presented a symposium of experience as to the advantage of double-working apples on vigorous stocks. The value of top-working to increase hardiness of stock in a trying climate is unquestioned. It markedly reduces injury from certain diseases. Northern Spy, especially, promises to reduce injury from the woolly aphis in the South. Weak-growing varieties are benefited by the practice. Early bearing can be promoted by top-working on a weak stock, although at the expense of productiveness and doubtless of longevity. But for ordinary varieties in favorable regions the advantages of top-working are outweighed by the disadvantages.

Earle J. Owen discussed The Importance of Selection in Plant Breeding, citing several striking examples of its application.

L. C. Corbett raised the query, What is to be the Future Application of the Term Horticulture? To the already recognized subdivisions of horticultural interests in America, namely, olericulture, pomology, floriculture, and landscape gardening, the author would add plant breeding and plant propagation. Under the latter head is comprised nursery work and the increasing of annual plants from seed or from herbaceous cuttings.

H. J. Eustace gave an account of investigations on apple decays in commercial cold storage. Several varieties of apples were inoculated with black rot, brown rot, bitter rot, soft rot or blue rot, and a species of Alternaria, and at once put in cold storage at a constant temperature of 30 to 32° F. At the end of two months none of these diseases had developed except the soft or blue rot. Later, when the inoculated fruit was taken out of storage, the other diseases also developed, showing that the low temperature of the cold storage simply retarded the fungi in their development but did not destroy them. In another experiment, where the temperature ranged from 37 to 56°, decays developed slowly, except the soft rot; but when the temperature ranged from 54 to 65.5° all decays developed and in most cases very rapidly. Peaches similarly inoculated and held in cold storage two weeks developed decays in about one-half of the specimens.

Prof. W. R. Lazenby read a paper on the use of colored cloth in shading plants. Cabbage, tomato, lettuce, and geranium plants, as well as seeds of corn, peas, beans, and radishes were grown under ordinary white cheese cloth shade, as well as cheese cloth colored black, red, blue, and yellow. Corn and bean seeds came up most readily under the black cloth, but the plants under both black and red cloth soon

began to show weakness and decline in rate of growth. The early shading of rhubarb with black cloth gave excellent results in lengthening the petiole and diminishing the size of the leaf blade. On the whole, the observations indicate "that black bunting may be profitably used as a shade in early spring and possibly at a later date on certain crops, like celery, cauliflower, etc. It may also hasten the maturity of certain vegetables, like tomatoes, when used after the plants or fruit are well developed." Other benefits from shading are the protection of the plants from frost, and from certain insects, like the radish fly and beetle.

H. P. Gould described the recording of phenological data for pomological uses as carried on by the U. S. Department of Agriculture for several years past.

Abstracts of L. H. Bailey's address on The Field for Experiment in Horticulture and John Craig's paper on Plant Growing by Artificial Light were not obtained.

Forestry Instruction at Armstrong College.—The forestry branch of Armstrong College, Newcastle-on-Tyne, has been given charge of the local management of Chopwell Woods in the county of Durham. These woods are within a few miles of the college and contain nearly 900 acres of larch, spruce, Scotch pine, oak, ash, and other trees, most of which were planted about 50 years ago. A house is being built in the woods for the college lecturer in forestry, and arrangements made for the holding of short courses for practical foresters. It is believed that this addition to the college will make it one of the most favorable centers for forestry instruction in the United Kingdom.

Macdonald College.—The New York *Evening Post* is authority for the statement that Sir William Macdonald has completed arrangements for transferring the new Macdonald College, at St. Anne de Bellevue, near Montreal, which was established by him, to McGill University. The property is valued at between $2,000,000 and $3,000,000, and has a fund amounting to $2,000,000. It is the founder's wish that it should rank as a college of McGill University.

A New Sugar School.—A professional sugar school was opened at St. Ghislain, Belgium, May 1, 1906, with 12 students in attendance. The course of study includes the following subjects: Physics and general chemistry; analytical and applied chemistry; sugar technology, sugar chemistry, and sugar legislation; general mechanics and industrial electricity; mathematics; sugar accounts; geometrical drawing, industrial drawing, and industrial economy. The course covers two years and leads to a diploma.

Irish Scholarships in Agriculture.—The Department of Agriculture and Technical Instruction for Ireland offers scholarships at the Royal College of Science in Dublin and the Albert Agricultural College, Glasnevin, each scholarship to include free tuition for one year, a third-class railway fare to and from college, and either a maintenance allowance of $5.00 a week if in attendance at the Royal College of Science or free board and lodging at the Albert Agricultural College. The scholarships are good for one year, but may be renewed for two or three years to enable students to complete the agricultural course.

A Summer School Course in Children's Gardens.—The New York University is conducting a six weeks' course in children's gardens in connection with its summer school, which opened July 2. The course is under the direction of Henry Griscom Parsons, Assistant Director of Children's Gardens in New York, and about 25 young women have been enrolled.

School Gardens in England.—According to a recent report in the *Agriculturist Economist* there are in Surrey County, England, under the control of the Surrey Education Committee, 61 sets of children's gardens attached to the elementary schools, where no less than 1,000 boys are being taught practical gardening. Tools and seeds are supplied and a capable instructor is employed.

Miscellaneous.—The degree of doctor of science was conferred upon Dr. A. C. True, director of this Office, by Wesleyan University.

Dr. D. E. Salmon, formerly chief of the Bureau of Animal Industry of this Department, has accepted an offer of the Government of Uruguay to organize a bureau of animal industry for that government, and will proceed to that country next December.

Prof. William Schlick, of St. John's College, Oxford, has been constituted professor of forestry.

W. P. Wright, horticultural instructor in Kent County, has been appointed superintendent and lecturer of the horticultural department of the Southeastern Agricultural College at Wye, England. A definite course along this line is to be established at the college.

The Cuban Government has recently instituted an official publication of the secretary of agriculture, industry, and commerce, entitled *Boletin Oficial de la Secretaria de Agricultura, Industria y Comercio*, Vol. I, No. 1 of which has been received. It is announced that the experiment station will be a contributor to this publication, and the first number gives the full organization of the station, which includes 21 persons.

Le Bambou is the name of a new French monthly publication, which is to be devoted entirely to the study, culture, and uses of bamboo. It is published at Mons, Belgium, by the editor, Jean Houzeau de Lehaie. The first number was issued January 15, and contains 40 octavo pages.

The Rhine Province Dairy Institute at Zülpich was removed to Griethausen, near Cleve, on April 1, 1906.

EXPERIMENT STATION RECORD.

VOL. XVII. AUGUST, 1906. No. 12.

The second session of the Graduate School of Agriculture, held at the College of Agriculture of the University of Illinois, July 2–28, was a marked success from beginning to end. As is generally known the graduate school has been adopted by the Association of American Agricultural Colleges and Experiment Stations, and the colleges represented in that organization tax themselves for its support. In its general management of the enterprise, the association is represented by its standing committee on graduate study, of which Director L. H. Bailey, of Cornell University, is chairman. The University of Illinois very generously extended an invitation to hold the school under its auspices this year, and its success was due in no small measure to the excellent facilities afforded by the College of Agriculture and the efforts of its personnel. Dr. A. C. True, Director of the Office of Experiment Stations of the U. S. Department of Agriculture, was again selected as dean of the school, and Prof. Eugene Davenport, dean of the College of Agriculture of the University of Illinois, acted as registrar. Courses were given in agronomy, horticulture, plant physiology and pathology, zootechny, and plant and animal breeding, with special reference to the production of plants and animals suited to the conditions in the Mississippi Valley and the Great Plains. These included lectures and seminars, but no laboratory exercises.

The faculty consisted of 35 of our leading agricultural teachers and investigators, including 5 officers of the U. S. Department of Agriculture, 12 members of the faculty of the College of Agriculture of the University of Illinois, and 18 professors and experts from 16 other agricultural colleges and experiment stations. Aside from these there were several outside men who lectured at the school, among whom were the statistician of the Union Stock Yards at Chicago, representatives of a large commission house in Chicago and of Swift & Co., Maj. David Castleman, who spoke on the breeding of saddle horses, and Mr. N. H. Gentry, the famous breeder of Berkshire pigs.

The total enrollment of the school was 131, of whom 91 were classed as students. These came from 34 States and Territories. Hungary was represented by a professor from the University of Budapest, and

there were three students from India. In addition, there were a considerable number of persons who came as visitors, to attend the exercises for a few days, who were not registered. The attendance, therefore, considerably exceeded that of the previous session, at Ohio State University, at which 75 students were registered.

The opening exercises of the school were held on the evening of July 4, when the school was welcomed to the University by Dr. T. J. Burrill, vice-president of the University. Prof. L. H. Bailey presided and made an address in which he pointed out the need of a comprehensive system of agricultural education comprising institutions or departments for research, graduate study, college courses, extension work, and secondary and elementary courses. The graduate school is needed to aid in the more complete establishment of such a system and to stimulate workers in our agricultural institutions to more thorough study and research.

Dr. A. C. True gave a short history of the graduate school and pointed out the great development of agricultural education and research in this country since the first session of the school was held four years ago. He also called attention to the pressing need for more trained workers in different branches of agricultural service. The claim was made that the battle for adequate recognition of agriculture in our higher institutions of learning is essentially won and that our leading educators are convinced that agriculture in some form should constitute part of the industrial element of public school education. It was pointed out that so great is the public interest in agricultural education and research that funds are coming to our agricultural institutions fully as fast as they can be utilized, and that a very great responsibility is being laid on our agricultural teachers and scientists to make the best use of the money put in their hands.

A paper by Dr. H. W. Wiley, Chief of the Bureau of Chemistry of the U. S. Department of Agriculture, was also presented, in which the meager opportunities for study along agricultural lines in preparation for the doctor's degree at our leading universities were shown. These were contrasted with the wider opportunities for such work offered in the German universities and the greater extent to which advanced study in agricultural lines is encouraged. Dr. Wiley declared that "there are no problems of a strictly scientific character which at the present time have more intimate relations to the welfare of the people than those which are connected with agriculture. The field of research also in this region is more fruitful, the number of problems greater, and the opportunities for discovery wider than in almost any other field of scientific investigation. The establishment of agricultural colleges and experiment stations is giving proper training to a vast body of young men, many of whom ought to enter the university and continue

the studies of their college days. . . . What the friends of agriculture should ask is that in the future our great universities should recognize agricultural science as one of the leading branches to which attention should be paid in graduate studies."

Several conferences and informal meetings were held during the session of the school, and a National Association of Dairy Instructors and Investigators was formed. A conference for the discussion of general questions relating to the organization of agricultural education and research was held July 7. Dean Davenport outlined the organization of the College of Agriculture of the University of Illinois. The system followed there involves the division of authority and work in such a manner that definite responsibility is laid on officers in the several departments and full credit is given for each man's share in the work. Questions involving "team work" are discussed at meetings of the workers, and every effort is made to secure full agreement on plans before their execution is attempted. In order to secure financial and moral support for the college and station the farmers' organizations throughout the State are taken into confidence, and the responsibility for the proper maintenance of the institution is laid on their shoulders.

Professor Bailey argued in favor of the establishment of regular provision for agricultural studies leading to the doctor's degree in our universities and would make this a matter to be controlled by the university rather than by the college of agriculture. He also favored the simplification of degrees and would have Ph. D., M. S., and B. S. (or M. A. and B. A.) the only degrees to be conferred in course. This suggestion met with much approval from members of the graduate school.

Dr. W. H. Jordan, director of the New York State Experiment Station, spoke very earnestly of the need of more thorough scientific research along agricultural lines, and impressed his hearers with the great importance of maintaining the strictest integrity in making and recording agricultural investigations.

Dr. W. O. Thompson, president of Ohio State University and one of the founders of the graduate school, gave a brief account of the origin of the school, and expressed his strong belief in its value as an aid to broadening and strengthening our system of agricultural education. He predicted that it would have a career of increasing success and usefulness. Dr. Brown Ayres, president of the University of Tennessee, spoke from the standpoint of one interested in general educational advancement, and emphasized the importance of the movement for the development of a thorough system of agricultural education.

A conference on extension work in agriculture was held July 21, at which great interest in this feature was developed. Resolutions

favoring the aid of the Office of Experiment Stations in this direction were adopted.

A meeting of dairy instructors and investigators July 17–19 resulted in the formation of a national organization, as mentioned above. At this meeting a regular programme was presented, covering the whole range of dairy teaching and experimentation. The papers and discussion brought out the urgent need of scientific investigation to solve many practical problems in dairying and in the feeding of dairy cattle. Emphasis was placed on the demand for more and better trained men in dairy work, and on raising the standard of dairy instruction. Prof. R. A. Pearson, of Cornell University, was elected president of the association, C. B. Lane, of the U. S. Department of Agriculture, secretary-treasurer, and committees were appointed upon various topics.

Informal meetings were held several evenings at which questions relating to various phases of agricultural education were discussed. Among these were the methods of teaching agronomy, the organization of secondary and elementary courses in agriculture, and the science of agriculture as a basis for the organization of a system of agricultural education. These meetings were to some extent a continuation of the daily sessions and seminars. This atmosphere of discussion of matters of fundamental importance in agricultural education and research was probably one of the most beneficial features of the school.

On Saturday, July 14, about 70 members of the school visited the estate of the Funk Bros., near Bloomington, Ill., comprising about 25,000 acres, where crop and animal production on a large scale was seen under the best conditions, as well as considerable experimental work in breeding oats and corn.

When news came of the death of Hon. H. C. Adams, the school adopted resolutions expressing their appreciation of the services rendered to the cause of agricultural education and research by Mr. Adams, in securing the passage of the act "which will forever bear his name and associate him in the minds of our people with Senator Morrill, of Vermont, and Representative Hatch, of Missouri, through whose wise statesmanship our agricultural colleges and experiment stations have been established and maintained."

The interest in the work of the school was well sustained throughout the session. There was considerable going and coming of students, a few even registering during the last week. Even those who stayed only a few days seemed to feel that they had received inspiration and information which made their coming to the school worth while. The students were unanimous in their expressions of the benefits and the broadening influence of the school, and in the general hope that another session might be held two years hence.

RECENT WORK IN AGRICULTURAL SCIENCE.

AGRICULTURAL CHEMISTRY.

The examination of materials important in agriculture and the industries, J. König (*Die Untersuchung landwirtschaftlich und gewerblich wichtiger Stoffe. Berlin: Paul Parey, 1906, 3. ed., rev., pp. 1100, pl. 1, figs. 352*).—This is the third revised edition of this practical handbook of methods of examination of soils, manures and fertilizers, ashes, feeding stuffs, seeds, milk and dairy products, fats and oils, honey; materials and products of sugar, starch, spirits, beer, and wine making; water, dust and smoke injurious to vegetation, wool, beeswax, lubricants, etc.

New official Italian methods of analysis of fertilizers, L. Sicard (*Ann. École Nat. Agr. Montpellier, n. ser., 5 (1906), No. 4, pp. 300–323*).—The methods adopted by the directors of the agricultural experiment stations and laboratories of Italy in convention held in Rome in July, 1904, are described and critically discussed and compared with other methods for the same purposes. These include general methods of determining moisture, nitrogen, total phosphoric acid, potash, and iron and aluminum oxids, and methods of analysis of special fertilizers, such as superphosphates, aluminum phosphate, Thomas slag, ammonium sulphate, sodium nitrate, and farm manure.

A further note on the determination of phosphoric acid by the citrate method, V. Schenke (*Landw. Vers. Stat., 64 (1906), No. 1, pp. 87–91; abs. in Chem. Centbl., 1906, I, No. 19, p. 1573*).—This is a reply to criticisms of the author's method by F. Mach (E. S. R., 17, p. 731), in which further analytical data in substantiation of the accuracy of the method are reported.

A method of detection and determination of small quantities of iron, A. Mouneyrat (*Compt. Rend. Acad. Sci. [Paris], 142 (1906), No. 19, pp. 1049–1051*).—A colorimetric method based upon the green coloration produced when hydrogen sulphid is passed through an alkaline solution of iron is described. It is claimed that the method is applicable to solutions containing from 1 part of iron to 1,000 parts of solution to 1 part to 100,000, and is more sensitive than the sulphocyanid method, being especially applicable in biological investigations.

Tables for use in nitrogen and protein determinations, F. E. Hepner (*Wyoming Sta. Rpt. 1905, pp. 61–71*).

The determination of nitrogen in milk, M. Popp (*Milchw. Zentbl., 2 (1906), No. 6, pp. 263–268*).—This report of experiments concludes with the following outline for determining nitrogen in milk: Into a short-necked digestion flask are put 10 gm. of milk (measured with a pipette), 25 cc. of pure concentrated sulphuric acid, 1 to 2 gm. of mercury, and some sharp-cornered pieces of glass. After heating gently for 10 minutes, 10 gm. of potassium sulphate is added and the mixture boiled for 30 minutes. After cooling and transferring to the distillation flask, 5 gm. of zinc dust is added and also the necessary sodium hydroxid when the distillation and determination are made in the usual way.

The laboratory book of dairy analysis, H. D. Richmond (*London: C. Griffin & Co., Ltd., 1905, pp. VIII + 90*). This handbook on the composition and analysis of milk is intended for both the dairy manager and the trained chemist.

New rapid method for the determination of fat in milk without the use of acid, N. GERBER (*Rec. Gén. Lait, 5 (1906), No. 14, pp. 318–321*). In this method, designated the salt method, the same apparatus is used as in the Gerber acid method, but the casein is dissolved by means of an alkaline solution, the exact composition of which is at present secret. Comparative determinations by the salt and acid methods are reported. They show very close agreement.

The salt method, M. SIEGFELD (*Molk. Ztg., 20 (1906), No. 14, pp. 371–373*).—The salt mixture used in dissolving the casein in this new Gerber method is said to consist of sodium chlorid, sodium hydroxid, Rochelle salt, and a small quantity of coloring matter.

A solution is made by dissolving 230 gm. of this mixture in 1 liter of water. Eleven cc. of this solution, 10 cc. of milk, and 0.6 cc. of isobutylalcohol are mixed in the acid butyrometer, which is then placed in a water bath at 45° C. for 3 minutes and then centrifuged for 3 minutes. The reported results by the salt method are essentially the same as those by the acid method. The salt method is said to be uninfluenced by the presence of formalin or potassium bichromate in the milk.

On the importance of determining the freezing point in milk analysis, A. A. BONNEMA (*Pharm. Weekbl., 43 (1906), No. 18; abs. in Rev. Gén. Lait, 5 (1906), No. 15, pp. 346, 347*).—The average freezing point of fresh cows' milk was found to be −0.555° C., which was increased as much as 0.02° by allowing the milk to stand for several hours or by boiling. Lactic fermentation lowered the freezing point. The importance of cryoscopy in detecting adulteration of milk is discussed.

The detection of cocoanut oil in butter, A. W. THORP (*Analyst, 31 (1906), No. 363, pp. 173–175*).—The author determines the Reichert-Wollny number in the usual way, then adds 110 cc. of water to the flask, and distills off a second 110 cc. and titrates this with tenth normal sodium hydroxid. The insoluble volatile acids are then dissolved in 100 cc. of 90 per cent alcohol slightly warmed and this is also titrated with the tenth normal soda solution.

The number of cubic centimeters of the tenth normal soda solution required in the 3 determinations were respectively 29.2, 3.1, and 7.6 for normal butter and 8, 4, and 34 for cocoanut oil. The addition of 10 per cent of cocoanut oil to butter increased the third determination to 10.2 and the addition of 90 per cent to 29.1. In no instance did the alcoholic solution show a higher number than 8.4 for pure butter.

Plant lecithin; a preliminary communication, E. WINTERSTEIN and O. HIESTAND (*Ztschr. Physiol. Chem., 47 (1906), No. 4–6, pp. 496–498*).—From their studies of the lecithin of cereals, lupines, and grasses, the authors are of the opinion that the name lecithin should no longer be applied to the organic bodies containing phosphorus, which occur in plants and are soluble in ether and alcohol, but that they should be termed phosphatides as has been suggested for similar products of animal origin.

Experiments on amino acids, polypeptids, and proteids, E. FISCHER (*Ber. Deut. Chem. Gesell., 39 (1906), pp. 530–610*).—The cleavage of proteids yields, in addition to ammonia, albumoses, peptones, and finally amino acids. Albumoses and peptones are complex bodies but the acids are comparatively simple and the study of the chemical structure of proteids has been approached through this group.

The investigations have included synthesis and other studies of such acids, and several new and important methods of working with them and other products of proteid hydrolysis have been evolved. The general purpose of the author's work at present is to unite two or more amino acids to form a complex molecule and in this he has been successful and about 70 such bodies have been produced by his methods. The name polypeptids is proposed for these compounds, which are designated dipeptids, tripeptids, etc., according to the number of acid radicals entering into their structure. A tabular list of polypeptids is given. As a class polypeptids exhibit many

characteristics of proteids and in general it may be said that the author at present believes that albumins are polypeptids as regards structure.

The identification of sugar in mace and in cinnamon, E. Spaeth (*Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 8, pp. 447–450*).—A controversial article in which the author again states that sugar is a normal constituent of mace and cinnamon and summarizes data regarding its occurrence and estimation.

A new method of estimating organic phosphoric acid in flour and flour products, C. Arragon (*Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 9, pp. 520, 521*).—The proposed method consists essentially in extracting organic phosphorus with alcohol, igniting the residue obtained after evaporation, and determining the phosphorus as magnesium pyrophosphate.

The detection of sawdust in flour and bread, P. Paganini (*Gior. Farm. e Chim., 54 (1905), pp. 5–11; abs. in Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 9, p. 530*).—The method of detecting sawdust depends upon the fact that wood when treated with paraphenylendiamin and acetic acid gives an orange-red color. Neither wheat flour nor corn meal gave such reaction.

The brown deposit found on aluminium vessels in which water has been boiled, C. Formenti (*Chem. Ztg., 29 (1905), No. 55, p. 746; abs. in Hyg. Rundschau, 16 (1906), No. 10, p. 557*).—The brown deposit, the author states, is graphite-silicic acid, and is harmless.

METEOROLOGY—WATER.

Report of the meteorological council (*Rpt. Met. Council [Gt. Brit.], 1905, pp. 227, pls. 2, fig. 1, map 1*).—This consists as usual of administrative reports regarding organization and operations (during the year ended March 31, 1905) in marine meteorology, forecasts and storm warnings, climatology, publication, and miscellaneous subjects, with appendixes relating to conspicuous meteorological occurrences in 1904, operations of the office in the 50 years since 1854, lists of logs and other documents received during the year, reports on inspections of meteorological stations, accessions to the library, list of persons and institutions to whom publications are sent, distribution of instruments, and financial statement.

The methods of distribution and the accuracy of weather forecasts are discussed, and it is shown that during the year 1904–5 57 per cent of the forecasts were completely successful, 31 per cent partially successful. The averages for 1895 to 1904 are 55.5 per cent completely successful, 28.2 per cent partially successful. The percentage of successful storm warnings in 1904 was 89.8.

The work of the station of agricultural climatology of Juvisy during 1905, C. Flammarion (*Bul. Mens. Off. Renseigts. Agr. [Paris], 5 (1906), No. 4, pp. 433–455, figs. 6*).—A record is given of observations on atmospheric pressure, temperature of the air, soil, and underground water, relative humidity, rainfall, sunshine, and radiation, in continuation of those of previous years (E. S. R., 17, p. 440). Studies of the effect of different rays on plants and animals were also made as in previous years. Inconclusive studies of the influence of the moon on the germination and growth of various crops which have been noted elsewhere (E. S. R., 17, p. 532) are recorded.

The general course of the temperature of the air and of the soil at depths of 0.25, 0.5, 0.75, 1, and 1.5 meters was analogous throughout the year. During October, November, December, January, and February there was a series of rising temperatures which increased with the depth in the soil; in May, June, July, and August a series of falling temperatures which decreased with the depth. The temperature curves thus crossed in spring and again in autumn. The mean temperature of the water in wells about 14 meters deep was 11.3° C., 1.6° higher than that of the air, and the annual variation in temperature was 1.4° C.

Meteorological records for 1904 (*New York State Sta. Rpt. 1904, pp. 435–441*).—Tables are given which show the average monthly precipitation since 1882; average

monthly temperature since 1882; tridaily readings of the standard air thermometer during each month of 1904; a monthly summary of maximum, minimum, and standard thermometer readings; and daily readings of maximum and minimum thermometers at 5 p. m. for each month of the year.

Meteorological summary, C. B. RIDGAWAY (*Wyoming Sta. Rpt. 1905, pp. 76, 77*).—A summary of observations at Laramie, Wyo., on temperature, atmospheric pressure, precipitation, evaporation, and direction and velocity of the wind during the year 1904. The mean temperature for the year was 41.9° F., the highest 83, July 12 and 15, the lowest −16, January 28; the mean barometric pressure was 23.024 in.; the total precipitation was 9.58 in., the mean for the past 10 years being 9.8 in.; the evaporation from May 7 to September 15 was 1.866 ft.

The climate of Naples during the meteorological year 1903–4, E. ANNIBALE (*Bol. Soc. Nat. Napoli, 1. ser., 19 (1905), pp. 65–96*).—Observations on atmospheric pressure, temperature, humidity, precipitation, direction of the wind, cloudiness, and storms are summarized and discussed.

The rainfall régime and crops in Russia, H. SAGNIER and E. TISSERAND (*Bul. Soc. Nat. Agr. France, 66 (1906), No. 1, pp. 32–38*).—Statements by A. Yermoloff regarding the dependence of crops, particularly wheat, upon the amount and distribution of spring rains, especially in central Russia, and the failure of crops in seasons of deficient or badly distributed rainfall, are reported and commented upon.

Weather forecasting (*Abs. in Rev. Gén. Sci., 17 (1906), No. 8, pp. 350, 351*).—A report by Durand-Gréville to the Belgian Astronomical Society on laws of storm movements in relation to weather forecasting is briefly reviewed, and a plea is made for a better system of weather forecasting in France.

Protection of crops against hail in 1905 by means of cannon and bombs, H. DUFOUR (*Chron. Agr. Vaud, 19 (1906), No. 7, pp. 198–207*).—The results of the campaign of 1905 are briefly summarized and the present status and possibilities of this method of protection are discussed.

On the construction of isobaric charts for high levels in the earth's atmosphere and their dynamic significance, J. W. SANDSTRÖM (*Trans. Amer. Phil. Soc., 21 (1906), No. 2, pp. 31–95, pl. 1, figs. 15*).—It is shown how such charts can be constructed from meteorological observations obtained by means of kites and balloons in the free air, and the connection of the charts with the dynamics of the atmosphere is discussed. "It is to be expected that upon such maps we may easily and naturally present our observations and experience as to atmospheric movements and, therefore, it would seem to promise good results if the daily weather predictions could be based upon such maps."

The gases of the atmosphere, W. RAMSAY (*New York and London: The Macmillan Co., 1905, 3. ed.; rev. in Chem. News, 93 (1906), No. 2422, p. 199*).—The principal new feature of this edition is a chapter on radio-activity and radio-active gases.

Water and its use for industrial and technical purposes, E. LEHER (*Das Wasser und seine Verwendung in Industrie und Gewerbe. Leipsic: G. J. Göschen, 1905, pp. 124, figs. 15*).—A concise treatise on the occurrence, physical and chemical properties, and testing of water, the technology of water for potable purposes, steam boilers, and special technical processes, water storage, and the disposal of sewage.

The culture of anaerobic micro-organisms as applied to water analysis, A. GUILLEMARD (*Ann. Inst. Pasteur, 20 (1906), No. 2, pp. 155–160, fig. 1*).—It is claimed in this article that present methods of bacteriological examination of water are defective in that account is taken only of the number of organisms which develop in the presence of air and that the probably equally important anaerobic organisms are not taken into consideration. A method for studying the relation between aerobic and anaerobic organisms in water is described, especially the apparatus and method to be used in the culture of anaerobic organisms in an atmosphere of hydrogen.

The use of copper sulphate in water filtration, H. W. CLARK and S. DEM.

GAGE (*Jour. Infect. Diseases, 1906, Feb., Sup. 2, pp. 172–174*).—Investigations are briefly reported which indicate that the use of copper sulphate as a preliminary treatment in the purification of sewage results in a lowering of the efficiency of subsequent filtration and bacterial purification of the filter bed.

On the bactericidal action of copper, H. W. CLARK and S. DEM. GAGE (*Jour. Infect. Diseases, 1906, Feb., Sup. 2, pp. 175–204*).—An account is here given of a series of experiments in which waters were treated with definite amounts of copper or copper sulphate or placed in contact with metallic copper and allowed to absorb an unknown amount of copper. The efficiency of the treatment was measured by its effect on the total number of bacteria and on the numbers of *Bacillus coli* and *B. typhosus* in the water.

The conclusion is reached that the treatment of water with copper sulphate or by storing in copper vessels has little practical value because it is not absolutely effective and is therefore dangerous in the hands of the general user. It was found in some cases that in order to insure the complete destruction of *B. coli* and *B. typhosus* it was necessary to use copper sulphate at the rate of 1 part to 1,000 of water, in which case the water was of a strongly astringent taste and would be repugnant to the user. Allowing water to stand in copper vessels for short periods was occasionally effective in removing *B. coli* and *B. typhosus*. In other cases, however, the very dilute solutions of copper sulphate or colloidal copper absorbed from contact with clean metallic copper appeared to have a decidedly invigorating effect on bacterial activity.

The resistance to decomposition of certain organic matters in sewage, H. W. CLARK (*Jour. Infect. Diseases, 1906, Feb., Sup. 2, pp. 136–138*).—It is shown in this article that a certain small percentage of exceedingly stable carbonaceous and nitrogenous matter accumulates year after year in filters used for ordinary domestic sewage and seriously impairs their efficiency. This material was found to resist nitrification and is believed to be of a carbonaceous rather than nitrogenous nature.

Biological purification of sewage waters, RICHE (*Ann. Chim. Analyt., 11 (1906), Nos. 1, pp. 16–19; 2, pp. 64–69*).—The importance of biological processes as compared with chemical methods is discussed and various methods in which biological processes play a prominent part are considered, especially from the standpoint of disposal of Paris sewage. These include irrigation, and filter bed, septic tank, the Candy (intermittent sprinkling and carboferrite) method of treatment, and others.

A consideration of the difficulties in the way of disposing of the Paris sewage by means of irrigation leads to the conclusion that the only solution of the problem appears to be a combination of bacterial purification and irrigation.

Recent views of the sewage disposal problem (*Engin. Rec., 53 (1906), No. 4, pp. 87, 88*).—This is a brief editorial review of the recent rapid progress in this field, which is ascribed largely to progress in adopting better methods of sewage analysis, which yield fairly comparable results.

It is stated that "the old idea that sewage farming is the best method of disposal was exploded long ago, and the sewage farms still in service are not kept in operation because they afford the most economical method of treatment, as a rule. The rise of intermittent filtration has similarly reached its culmination. It is acknowledged to be the most perfect method of treatment when all conditions are favorable, but it is now known that it is much more expensive than was formerly anticipated, and the character of the effluent which it furnishes is often unnecessarily good for discharge into the body of water receiving the purified sewage. . . .

"Under these circumstances specialists in sewage treatment have been working to ascertain just what methods are best for securing different degrees of purification from the partial clarification resulting from simple sedimentation to the extreme

degree of purification attained with the best intermittent filters under the best operating conditions. . . .

"Along with this recognition of the varying requirements of sewage treatment are many new suggestions concerning the methods to be followed. The most interesting of these to the engineer who has not been following the development of the subject, is the closer connection which is gradually appearing between the principles of water purification and sewage treatment."

Present practice in sewage disposal (*Engin. Rec., 53 (1906), No. 4, pp. 97, 98*).—This is a summary of a paper presented by G. W. Fuller at a recent meeting of the New Jersey Sanitary Association.

The paper emphasizes the desirability of preparatory treatment with raw sewage to remove the sludge, combinations of methods of purification, and treatment of the effluents with copper sulphate or other germicides, and describes comparative tests which have been made by the city of Columbus, Ohio, of various methods of sewage disposal. The preparatory treatment found most effective in these trials was afforded by septic tanks holding an average flow of about 8 hours, followed by the use of sprinkling filters operating at an average rate of 2,000,000 gal. per acre daily.

The collection and preservation of samples of sewage for analysis, S. DeM. Gage and G. O. Adams (*Jour. Infect. Diseases, 1906, Feb., Sup. 2, pp. 139–148*).—Chloroform in amounts of 10 to 25 cc. to each gallon bottle is stated to be a good preservative for samples of sewage which are to be kept for some time before analysis.

SOILS—FERTILIZERS.

Some new properties of soils, J. König, J. Hasenbäumer, and E. Coppenrath (*Landw. Vers. Stat., 63 (1906), No. 5–6, pp. 471–478*).—This article discusses briefly the effect of steam on soils and the catalytic power and osmotic pressure of soils.

It is shown that by heating 250 gm. of a soil with 3 to 4 liters of water for 3 hours under a pressure of 4 atmospheres the solubility of the mineral constituents was increased to a considerable extent. Similar treatment acts like mercuric chlorid, chloroform, etc., in reducing the oxidizing or catalytic power of soils, which is ascribed to the action of oxydases (catalase) as well as bacteria. A device consisting of a Chamberland-Pasteur filter coated with gelatin rendered insoluble by the action of formaldehyde fumes for study of the osmotic power of soils is described, but no experiments with it are reported.

A study of rock decomposition under the action of water, A. S. Cushman (*Chem. News, 93 (1906), No. 2410, pp. 50–53*).—This is a discussion of this subject based largely upon investigations which have already been noted (E. S. R., 17, p. 301).

Data are presented to show that electrical endosmosis offers an efficient means of separating not only water but also acids or alkalis from slimy, colloidal, and otherwise unfilterable mixtures such as are obtained with very fine rock powders. It is shown that by successive grindings and treatment with an electric current the potash can be removed from orthoclase and other minerals containing potash.

In the experiments reported "definite weights of the rock powders were slimed with a measured quantity of water, and the slime placed inside an ordinary unglazed porcelain cup such as is used for certain common types of bell batteries. An ordinary arc-light carbon was then inserted and the porcelain cup set down inside a glass cylindrical vessel containing distilled water to the depth of 2 or 3 cm. Another carbon electrode was then inserted in the outside compartment. The cell was then connected with a direct current of about 110 volts, the inner or slime chamber being in connection with the positive pole.

"Under the action of electrical endosmosis all the liquid from the anode or slime chamber passed into the cathode chamber, while at the same time, owing to electrolysis, the free alkali passed out in a condition in which it could be easily titrated or otherwise estimated. In the course of a few hours the slime had been transformed

into a hard, comparatively dry cake, while the free alkali had been partially removed. The alkaline liquor in the cathode chamber was then poured out into a beaker and titrated with tenth-normal acid. After resliming the material in the anode chamber with the proper quantity of water, the apparatus was started again. With the conditions under which we were working it was found that about one hour sufficed for each run."

The absorption of potassium by soils, O. Schreiner and G. H. Failyer (*Abs. in Science, n. ser., 23 (1906), No. 583, p. 324*).—This is an abstract of a paper presented at the New Orleans meeting of the American Association for the Advancement of Science.

The absorption of potash by soils was studied by the same methods used in case of phosphates and an equation representing the absorption is worked out, which is as follows: $\frac{dy}{dr}=K(A-y)$, in which K is a constant, A the maximum amount of potassium the soil can absorb under the conditions of the experiment, and y the amount it has absorbed when a volume r of potassium solution has passed through the soil. "The removal by water of the absorbed potassium is rapid at first, but the concentration of the percolates soon reaches a constant value, although only a fractional amount of the absorbed potassium has been removed. As far as the observations have been made the solutions obtained by percolating a solution of potassium chlorid through the soil have always been acid."

The absorption of phosphate by soils, O. Schreiner and G. H. Failyer (*Abs. in Science, n. ser., 23 (1906), No. 583, pp. 324, 325*).—This is an abstract of a paper presented at the New Orleans meeting of the American Association for the Advancement of Science. The subject was studied by percolating different phosphate solutions through soils of several types in an apparatus especially designed for the purpose and analyzing separate fractions of the solution which passed through. The absorption phenomena are represented graphically, and a differential equation, which is said to quite accurately describe them, is given. It was found that the absorptive capacity for phosphates varied greatly in different soils, being as a rule most pronounced in the clays and loams and less so in the sandy soils.

"The solubility of the phosphate originally present in the soils was also determined by percolating water through the untreated soils in the above-mentioned apparatus. It was found that the concentration of the separate fractions of percolate was practically a constant for each of the soils studied. If this concentration is reduced through any cause, such as the absorption by plants or influx of rain water, the original concentration will be again restored by more of the phosphate of the soil entering into solution. If, on the other hand, the solution is somewhat stronger than the natural concentration for that soil through any cause whatever, such as the application of a soluble phosphate, the concentration is reduced by absorption to the original strength. . . .

"This constancy in the strength of the soil solution, so far as phosphate is concerned, is further shown by the removal by water of the absorbed phosphate, which has been similarly investigated. It was found that the concentration of the separate percolates decreases rapidly until the concentration is reduced approximately to that of the original soil solution. This concentration of phosphate is then maintained with much persistence, although only a fractional amount of the absorbed phosphate has been removed, thus indicating that while the absorbed phosphate is apparently rendered insoluble, it is, nevertheless, slowly but constantly going into the soil moisture and is, therefore, available to plants."

The absorption of phosphates and potassium by soils, O. Schreiner and G. H. Failyer (*U. S. Dept. Agr., Bur. Soils Bul. 32, pp. 39, figs. 6*).—A briefer account of the investigations reported in detail in this bulletin has already been noted (*see* above).

The solubility of phosphoric acid in sugar-beet soils, J. STOKLASA (*Bl. Zuckerrübenbau, 13 (1906), Nos. 1, pp. 1–9; 2, pp. 17–25, pls. 2; abs. in Chem. Ztg., 30 (1906), No. 16, Repert. No. 4, pp. 55, 56*).—The importance of carbon dioxid produced by micro-organisms in the soil and given off by plant roots as a means of rendering the soil phosphates assimilable is discussed.

It is estimated that 1 gm. of a humus soil contains probably 20 to 30 million micro-organisms, which, with a 20 per cent water content and a temperature of 15° C., are capable of producing 50 to 60 mg. of carbon dioxid per day. The most rapid production of carbon dioxid occurs in the soil at the depth of 10 to 40 cm. and amounts during the growing period (150 days) to 112.5 metric centners per hectare (5,010.12 lbs. per acre).

The author's observations indicate that the fine roots and root hairs of sugar beets are capable of producing as much as 960 kg. of carbon dioxid per hectare in 60 days. The carbon dioxid dissolved in water exerts a direct solvent action on the phosphates of the soil.

On the improvement of a soil relatively deficient in magnesia, T. NAKAMURA (*Bul. Imp. Cent. Agr. Expt. Sta. Japan, 1 (1905), No. 1, pp. 30–34*).—In pot experiments with a soil containing 17 times as much lime as magnesia it was found that although there was sufficient magnesia for the growth of barley plants, the addition of magnesia was very beneficial. The most favorable ratio of lime to magnesia was 7:1, provided the magnesia was applied in the form of sulphate.

"Since the best ratio of lime to magnesia for the growth of cereals was found to be 1:1 when magnesia was applied in the form of magnesite, it would have required 333 gm. magnesite per pot in order to attain the above ratio. As the best result was, however, obtained when 78.72 gm. magnesium sulphate were applied per pot, we may conclude that the relative value or agronomical equivalent of magnesium sulphate to magnesite is here nearly 23:100."

Meeting of the fertilizer section of the German Agricultural Society (*Mitt. Deut. Landw. Gesell., 21 (1906), No. 7, pp. 69–74*).—Short accounts are given of the discussion of the following topics: The use of commercial fertilizers in Bavaria, preservation of barnyard manure and its most profitable use, and the influence of deficiency or excess of rainfall on the action of fertilizers.

Investigations by Pfeiffer at Breslau and Immendorff at Jena on the preservation of manures are summarized. The latter show that there is a considerable loss of nitrogen in the stall, and this is greater if the manure is allowed to lie for some time (say 7 days) under the feet of the animals than if it is removed daily. Contact with already fermenting manure apparently hastens the loss of nitrogen. The loss is greater both in the stall and in the heap in warm weather than in cold.

Kainit and superphosphate gypsum used at rates of 1.5 to 2 kg. per 1,000 kg. of live weight of animal were practically worthless. The use of sulphuric acid and superphosphate gypsum in amounts (3 kg. per 1,000 kg. live weight) giving a permanent acid reaction quite effectively prevented loss of nitrogen, but this is not practicable on account of excessive cost. The use of peat litter is the most effective means of preventing loss. In the experiments reported the loss of nitrogen was reduced to 7.3 per cent. The loss of nitrogen was less when the liquid manure was separated from the solid than when the two were mixed.

The sale of sheep manure, F. DE BARRAU (*Jour. Agr. Prat., n. ser., 11 (1906), No. 11, pp. 341–343*).—A brief note on local trade in this article and on its composition and fertilizing value. The following analysis is reported: Nitrogen (organic and ammoniacal) 1.36 per cent, phosphoric acid 0.26 per cent, potash 1.17 per cent, water 60.33 per cent. The manure is valued especially by viticulturists. Attention is called to the danger of impoverishing the farm by selling this material without returning an equal amount of fertilizing material in some other form.

Fertilizers on cereal crops grown in rotation, C. E. THORNE (*Ohio Sta. Circ. 54, pp. 15*).—This circular summarizes the results of 12 years' experiments on the station farm at Wooster, 11 years on the test farm at Strongsville, in northeastern Ohio, and 2 years each on the test farms at Germantown in southwestern Ohio and Carpenter in southeastern Ohio.

The crops grown at Wooster and Strongsville were a 5-year rotation of corn, oats, wheat, clover, and timothy; on the other farms a 3-year rotation of wheat and clover. The fertilizers used were phosphoric acid in form of acid phosphate alone and combined 2 by 2, and all 3 together with potash in form of potassium chlorid and nitrogen as nitrate of soda. Experiments at Wooster with barnyard manure untreated and treated with gypsum, floats, and acid phosphate are also briefly reported.

The results show that corn and oats responded profitably to moderate applications of phosphoric acid on the soils experimented with, which are believed to be typical of the soils of the State in general. The addition of potash to phosphoric acid in the fertilizer sometimes, but not always, gave a profitable increase in the yield of corn and oats.

The use of potassium seems to be especially indicated in regions where hay and straw, as well as grain, have been sold off the land for a considerable period, or where tobacco, cabbage, or other crops, in which the entire plant is taken off the farm, have been extensively grown.

"The complete fertilizer, containing nitrogen and potassium, as well as phosphorus, nearly always produced a larger total increase of corn and oats than any partial fertilizer; but when the nitrogen and potassium were purchased in commercial fertilizers their cost was usually greater than the additional gain, over that produced by phosphorus alone, was worth.

"The complete fertilizer invariably produced a larger increase in the wheat crop than that given by any partial fertilizer, and on the hard-run land at the main station, which has been exhaustively cropped with cereals for 60 to 75 years, the additional increase in the wheat and hay crops resulting from the use of the complete fertilizer more than offset its largely increased cost, leaving a larger net gain than that obtained from any partial fertilizer; but on land that had been resting in pasture for many years or on land in a high state of fertility the increase from the complete fertilizer has not yet been sufficient to justify its use, if the nitrogen and potassium must be purchased in commercial carriers; but in farm manure nitrogen and potassium may be secured practically without cost, and these experiments have shown that such manure may be made as effective a carrier of these elements of fertility as the most active forms in which they are found in commercial fertilizers." The barnyard manure treated with acid phosphate or floats was an especially effective fertilizer.

Inoculation of leguminous plants (*Jour. Bd. Agr. [London], 12 (1906), No. 11, pp. 641-659, figs. 3*).—This is an account of tests by 13 agricultural colleges and experiment stations in Great Britain of Hiltner's nitragin and Moore's inoculating material distributed by the Board of Agriculture. The general plan of the experiments include laboratory tests with sterilized soil or sand, pot cultures in unsterilized soils from various sources, and tests in accord with actual agricultural or horticultural practice, including inoculation of areas of field soil of various sizes.

"As a result of all the reported experiments, it seems evident that the cultures used were not uniform, it is not possible, however, to determine the extent to which the failures are to be attributed to this cause. It seems, however, from the positive results recorded that not only are these cultures sometimes able to produce nodules on the roots of plants new to a neighborhood, but that even in cases where the leguminous crop had been grown in the previous year benefit may be derived from inoculation.

"It is quite evident that the subject of plant inoculation in this country has not yet passed the experimental stage, and more work is required before one can feel at all justified in recommending either method for adoption on a field scale; nevertheless, the positive results obtained may lead farmers to hope that in the future benefit may be derived, in some instances at least, from the treatment of the soil or the seed before sowing, with inoculating materials preparatory to growing leguminous crops."

The fixation of atmospheric nitrogen (*Engineering* [*London*], *81* (*1906*), *No. 2090, pp. 89, 90; Sci. Amer. Sup., 61* (*1906*), *No. 1573, pp. 25205–25207*).—This is a review of investigations on this subject, including in some detail the recent developments along this line in Norway and a list of references to the more important literature of the subject.

Fixation of atmospheric nitrogen, P. A. Guye (*Electricien, 1905, Dec. 30, Sup., p. 417; abs. in Rev. Sci.* [*Paris*], *5. ser., 5* (*1906*), *No. 12, pp. 376, 377*).—Investigations on this subject are briefly reviewed, and it is pointed out that the progress made toward the development of commercially successful methods must be based upon scientific investigations and theoretical considerations.

The fixation of atmospheric nitrogen (*Rev. Gén. Sci., 17* (*1906*), *No. 6, p. 260*).—It is stated that the method of producing expanded arcs used by Birkeland and Eyde was first described by Plücker in 1861.[a]

On the utilization of atmospheric nitrogen, W. Löb (*Umschau, 10* (*1906*), *No. 14, pp. 265–271, figs. 7*).—An illustrated account is given of the Birkeland and Eyde process as carried out at Notodden.

The manufacture of nitric acid at Notodden, L. Grandeau (*Jour. Agr. Prat., n. ser., 11* (*1906*), *No. 10, pp. 296–299, figs. 4*).—The plant and methods used at this place for the preparation of nitric acid from atmospheric nitrogen by the Birkeland and Eyde process are described.

The factory at Notodden, Norway, for the manufacture of nitrate, L. Grandeau (*Jour Agr. Prat., n. ser., 11* (*1906*), *No. 11, pp. 328–330, figs. 2*).—Further descriptive details regarding the factory established at this point for the manufacture of nitrate from atmospheric nitrogen by the Birkeland and Eyde process.

The electric furnace of Birkeland and Eyde, L. Grandeau (*Jour. Agr. Prat., n. ser., 11* (*1906*), *No. 9, pp. 265–268, figs. 3*).—The principles of construction of this furnace are explained and statistics are given as to the extent to which it is being used in Norway in the preparation of nitrogen compounds from the air.

Calcium cyanamid (*Mark Lane Express, 94* (*1906*), *No. 3883, Fert. and Feed., p. 11*).—It is stated that the German Agricultural Society announces that it is now prepared to furnish this material, with 19 per cent nitrogen, in limited quantities for fertilizer tests at a cash price of about $53.53 per ton, in bags f. o. b.

Nitrogen and nitrogenous fertilizers, P. G. Wicken (*Jour. Dept. Agr. West. Aust., 12* (*1905*), *No. 3, pp. 252–256*).—This article explains briefly the different forms in which nitrogen occurs and discusses the fertilizing value of the nitrogenous fertilizers available for use in West Australia, including nitrate of soda, nitrate of potash, ammonium sulphate, soot, blood manure, bone dust, tankage, guanos, urine and night soil, oil cake, wool waste, decomposed hair and lime from tanneries and fellmongeries, barnyard manure, and seaweed.

Production of nitrate, R. E. Mansfield (*Mo. Consular and Trade Rpts.* [*U. S.*], *1906, No. 305, p. 53*).—The exports of nitrate from Chile to different countries during the year 1904 are given, the total being 740,869 tons, valued at $52,847,132.

The use of ammoniacal gas liquor as a fertilizer, C. Dusserre (*Ann. Agr. Suisse, 6* (*1905*), *No. 8, pp. 333–335; Bul. Mens. Off. Renseig. Agr.* [*Paris*], *5* (*1906*), *No. 2, pp. 183–185*).—Experiments with a liquor obtained from the gas works of Morges containing from 0.37 to 0.45 per cent of nitrogen, mostly in form of ammonia, but also containing small amounts of sulphid, cyanid, sulphocyanid, etc., are reported.

[a] Ann. Phys. [Poggendorff], 113, p. 252.

The material was applied to grass lands in connection with superphosphate, 500 kg. per hectare (445 lbs. per acre), and potash salts, 300 kg. per hectare (267 lbs. per acre) at rates of 5,000 to 15,000 liters per hectare (about 3,300 to 9,900 gal. per acre) on March 20 and June 8, before and after the first cutting of grass. The smaller application produced very little increase in yield. The larger application produced sufficient increase in yield to pay the cost of transportation and distribution. The addition of sulphate of iron, 500 kg. per hectare (445 lbs. per acre) further increased the yield and completely destroyed mosses in the grass. The use of the gas liquor resulted in the disappearance of leguminous plants from the herbage, but favored the development of the graminæ. The first application of the liquor burned the grass more or less, but it promptly recovered from this injury.

The general conclusion reached was that farmers in the vicinity of gas works may use this material with advantage if they can secure it free of cost. It may be applied with advantage during the winter on grass lands or on uncultivated land either directly or in mixture with liquid manure. Since it contains only nitrogen, it should be supplemented with phosphatic, potassic, and calcareous fertilizers. If applied directly during the summer it may seriously injure plants, but it may be safely used in mixtures with soil or compost.

Bone products, J. C. McNally (*Mo. Consular and Trade Rpts., 1906, No. 305, p. 155*).—A brief note is here given on the composition and fertilizing value of raw and degelatinized bone meal and precipitated bone phosphate. The use and value of the precipitated phosphate as a feeding stuff is also referred to.

Phosphate rock production, E. O. Hovey (*Amer. Fert., 24 (1906), No. 3, p. 21*).—Statements from advance reports of the U. S. Geological Survey are cited showing that the marketed production in 1905 probably exceeded 600,000 long tons as against 530,571 tons in 1904. There was a marked increase in production in Florida and Tennessee and a smaller increase in South Carolina. The average price of phosphate was higher in 1906 than in 1905 due to increased demand in Europe.

Potash as a fertilizer, P. G. Wicken (*Jour. Dept. Agr. West. Aust., 12 (1905), No. 5, pp. 422–424*).—A concise summary is here given of the principal facts relating to this subject.

Analyses of commercial fertilizers, M. A. Scovell et al. (*Kentucky Sta. Bul. 121, pp. 83–153*).—Analyses and valuation of 421 samples of fertilizers inspected during the spring of 1905 are reported.

Analyses of fertilizers, C. A. Goessmann (*Massachusetts Sta. Bul. 107, pp. 42*).—This bulletin gives market values of fertilizing ingredients and reports analyses of licensed fertilizers collected in the general market and miscellaneous fertilizing materials sent to the station for examination, including wood ashes, lime ashes, cob ashes, cotton-seed meal, Peruvian guano, meat and bone, tankage, factory waste, kiln-dried pulverized sheep manure, sheep manure, soils, muck, and complete fertilizers.

Analyses of fertilizers and insecticides, C. A. Goessmann (*Massachusetts Sta. Bul. 109, pp. 23*).—This bulletin includes notes on the taking of samples for analysis, instructions to manufacturers and dealers in commercial fertilizers, a discussion of trade values of fertilizing materials for 1906, and analyses of miscellaneous fertilizing and insecticide materials.

The list includes wood ashes, cotton-hull ashes, lime ashes, refuse ashes, nitrate of soda, cotton-seed meal, new process linseed meal, dried blood, high grade sulphate of potash, carbonate of potash, muriate of potash, double manure salts, kainit, dissolved boneblack, superphosphate, dissolved bone, ground bone, tankage, dry ground fish, carbonate of lime, prepared lime, cotton waste, cotton-seed compost, rotted cotton waste, damaged cocoa, glue refuse, leather dust, bone soup, refuse from wool washings, factory refuse, muck, peat, mud from the decomposition of seaweed, granulated tobacco stems, Peruvian guano, pigeon manure, complete fertilizers, soils, Paris green, arsenate of lead, and other insecticides.

Analyses of commercial fertilizers, P. SCHWEITZER and R. M. BIRD (*Missouri Sta. Bul. 66, pp. 8*).—This bulletin contains a report of analyses of commercial fertilizers collected during the fall of 1904 and the spring of 1905, as well as a financial statement of the receipts and disbursements of the fertilizer control fund for the year ended December 31, 1904.

Analyses of commercial fertilizers, P. SCHWEITZER and R. M. BIRD (*Missouri Sta. Bul. 70, pp. 11*).—This bulletin reports analyses of commercial fertilizers collected during the fall of 1905, and gives a statement of receipts and disbursements of the fertilizer control fund for the year ended December 31, 1905.

Commercial fertilizers, W. W. MILLER and N. W. LORD (*Offic. Rpt. Sec. Ohio Bd. Agr. on Com. Ferts., 1905, pp. 100*).—The results of inspection of fertilizers in Ohio during the year 1905 are given, with statements regarding the fertilizer control and the valuation of fertilizers, and the text of the State fertilizer law.

Licensed commercial fertilizers, 1906, F. W. WOLL and G. A. OLSON (*Wisconsin Sta. Bul. 134, pp. 1–17, 24–26*).—Analyses of 22 brands of fertilizers licensed for sale in Wisconsin during 1906 are reported, with a brief general discussion on the purchase, valuation, and use of commercial fertilizers, and the text of the State fertilizer law.

Fertilizers in Japan (*Bd. Trade Jour.* [*Gt. Brit.*], *1906, Jan. 4; abs. in Jour. Soc. Chem. Indus., 25 (1906), No. 2, p. 84*).—Statistics are given showing the extent and increase of use of fertilizers in Japan, especially of oil cakes.

The value of the fertilizers imported into Japan during the first 6 months of 1905 is reported to have been 12,976,352 yen ($6,462,223.30). Of this amount 7,265,109 yen ($3,618,024.28) was paid for oil cake, 638,217 yen ($317,832.07) for ammonium sulphate, 1,179,304 yen ($587,293.39) for calcium phosphate, and 636,997 yen ($317,224.51) for sodium nitrate. The oil cake comes from China, one-third of the nitrate from the United States, and the remainder from Chile and various other countries, the calcium phosphate and ammonium sulphate from the United Kingdom. There are several chemical factories at Osaka which produce fertilizers, especially ammonium sulphate.

Artificial fertilizers, P. G. WICKEN (*Jour. Dept. Agr. West. Aust., 12 (1905), No. 1, pp. 7–18*).—This article discusses especially the prices and value of the fertilizing materials available in West Australia, and gives formulas for fertilizer mixtures for various kinds of crops, with directions for their application. The draft of various crops on the fertilizer constituents of the soil is also explained.

AGRICULTURAL BOTANY.

Plant breeding, L. H. BAILEY (*New York and London: The Macmillan Co., 1906, pp. XIV + 483, figs. 43*).—This is a fourth edition of the author's work on plant breeding, which first appeared in 1895 (E. S. R., 7, p. 562).

The most marked changes in this work are to be found in chapter IV, which has been wholly rewritten and which gives a résumé of the investigations of de Vries, Mendel, and others, and in chapter V, which gives accounts of current plant-breeding practice. This last chapter summarizes the work of Burbank and Keeney, and the investigations of the experiment stations and of this Department along this line. A chronological bibliography of references to such literature as English-speaking horticulturists would be most likely to find completes the volume. The bibliography embraces something over 100 pages and is brought down to 1905.

On the correlation between calcium salts and the assimilation of nitrate nitrogen, V. V. YERMAKOV (*Zhur. Opuitu. Agron.* [*Russ. Jour. Expt. Landw.*], *6 (1905), No. 4, pp. 403–431*).—The formation of ammonia and oxalic acid when nitric acid acts on glucose suggested to the author the possibility of a similar reaction taking place in plants during the assimilation of nitrate nitrogen, whereby the ammonia

serves for the synthesis of albumin and the oxalic acid, precipitated by the calcium, remains without further influence. If this hypothesis were true, in the absence of calcium salts the oxalic acid formed would not be neutralized, and, being injurious to plants even in small quantities, would hinder the assimilation of the nitrate nitrogen.

To determine this subject the author carried out 3 series of experiments with leaves of grapes, *Paulownia imperialis*, and *Ailanthus glandulosa*. In these experiments the author used one side of the leaves of grapes and Paulownia and the leaflets on one side of the rachis of Ailanthus, the other portions remaining as a check. The nitrate nitrogen was determined by the Schultze-Tiemann method.

In the first series of experiments some of the leaves were placed for 24 hours in a 0.2 per cent solution of calcium nitrate and others in a 0.2 per cent solution of potassium nitrate. At the end of the experiments only traces of nitrate nitrogen were found in the leaves receiving the calcium solution, while the leaves placed in the potassium solution contained an appreciable quantity of nitrate nitrogen. This seems to indicate that in the leaves receiving calcium the nitrate was consumed by the plant.

In the second series of experiments the leaves were placed in a 0.2 per cent solution of potassium nitrate and were then cut in halves, some of which were used as controls while others were placed in various solutions. The results show that in the leaves which had received calcium salts the nitrate disappeared, being assimilated, while where no calcium salt was present the nitrate remained unaffected. The author concludes from this that calcium is indispensable for the assimilation of nitrate nitrogen.—P. FIREMAN.

The morphology and biology of nitrogen-assimilating organisms, L. LUTZ (*Les microorganismes fixateurs d'azote. Paris: J. Lechevalier, 1904, pp. 187, figs. 19; abs. in Centbl. Bakt. [etc.], 2. Abt., 15 (1905), No. 15–16, pp. 477, 478*).—The author gives a critical review of the literature relating to nitrogen assimilation by bacteria and other micro-organisms and practically gives a summary of the present status of knowledge on the morphology and biology of nitrogen-assimilating organisms.

After a historical résumé, the author gives an account of the attempts to cultivate the nitrogen-fixing organisms, particularly the experiments of Winogradski and Beijerinck, and of the cultures known as Alinit. The general conditions for fixation of nitrogen in the soil and factors limiting it are described, after which especial attention is given the morphology and physiology of the tubercles on the roots of the Leguminosæ and of the organisms which they contain. The literature on the culture of these organisms is reviewed at considerable length, and suggestions are given for the growth of the bacteria in nitrogen-containing and nitrogen-free media. The biological forms and physiological characteristics of the organisms are described and the various factors controlling nitrogen assimilation are reviewed. Accounts are given of various attempts in the utilization of the bacteria by applying them to practical use in the field, particularly on the use of pure cultures.

In addition to the Leguminosæ the author shows that tubercles of a similar nature occur on the roots of alders, Eleagnus, Podocarpus, Myrica, Datisca, etc.

A chapter is devoted to the fixation of free atmospheric nitrogen through symbiosis between algæ and bacteria by mosses, etc.

An extended bibliography of literature completes the volume, about 500 titles being cited.

Effect of differences in solar radiations on the transfer of albuminoids in wheat, J. DUMONT (*Compt. Rend. Acad. Sci. [Paris], 141 (1905), No. 18, pp. 686–688*).—It having been claimed that light is necessary for the formation of albuminoids in plants and that the more retrangible rays are most active in this respect, the author investigated the subject and reports experiments carried on during 2 different

seasons to test the effect of blue, black, red, and green colored screens on the production of grain and chaff of wheat.

In 1904 the wheat grown under the black screen was richest in nitrogen, followed by the specimens grown under green, blue, and red screens. In 1905 the experiments were repeated, and in this case the highest amount of nitrogen was found in the plants grown under the green screens, followed by those under the black, blue, and red.

Incidentally the effect of these different colored screens on germination was tested, and out of 100 grains selected, 92 germinated in the check, 94 under the black, 97 under the red, and 99 under the blue and green screens.

Anatomical and physiological changes produced in tropical plants by change of environment, D. Bois and I. Gallaud (*Compt. Rend. Acad. Sci. [Paris], 141 (1905), No. 24, pp. 1033–1035*).—Attention is called to the marked physiological and anatomical changes which take place in various economic tropical plants when taken from one region to another, and the failure to secure the successful economic introduction of many plants, such as rubber, fiber plants, etc., is attributed to these changes.

Wound stimuli, parasitism, and gum flow of the Amygdalaceæ, M. W. Beijerinck and A. Rant (*Centbl. Bakt. [etc.], 2. Abt., 15 (1905), No. 12, pp. 366–375*).—On account of the frequent occurrence of gum flow associated with certain diseases of species of Prunus, the authors have investigated the theories of the effect of wound stimuli to gum flow and the relation of parasites to wound stimuli.

The principal experiments were made with young shoots of the peach and of a reputed hybrid between the peach and almond. The effect of wounding the cambium in both young and old twigs is shown and comparisons are made with the stimulus caused by poisons, heat, etc. The influence of species of fungi in inducing wound stimuli is described, and gum flow is reported as associated with a considerable number of species. In conclusion comparisons are drawn between this form of gum secretion and the resins and gums produced by other plants.

Some experiments in the control of color in plants, H. Kraemer (*Abs. in Science, n. ser., 23 (1906), No. 585, pp. 423, 424*).—In a previous publication (E. S. R., 16, p. 540) the author shows that the unorganized or cell-sap color substances in plants readily react with various chemicals, producing in many instances marked changes in color. It was found that the majority of plant-color substances turned green when under the influence of calcium hydrate, deep red with organic acids, rich purple with potassium and aluminum sulphate, and blue with iron sulphate.

In 1904 the author carried on a series of experiments in this Department for the purpose of determining the effects of certain chemicals on the color principles of plants, the material studied being carnations, roses, and pansies, which were grown in the presence of a large number of chemicals. The results published are considered only preliminary, but it was found that in the case of La France roses the petals became of a uniform pink color when the plants were supplied with iron citrate and citric acid. Maroon roses became dark red when the plants were supplied with phosphoric acid, iron and ammonium sulphate, or sulphuric acid. The maroon roses when treated with sulphuric acid were found to take on a crimson color and they also tended to produce single flowers.

Some factors concerned in color production in a species of Fusarium, J. B. Pollock (*Abs. in Science, n. ser., 23 (1906), No. 585, pp. 422, 423*).—A series of experiments was carried on with species of Fusarium obtained from the cut ends of corn stubble.

One of the characteristics of the fungus is the bright salmon-pink color which develops on many artificial media under proper conditions. Among the conditions necessary for its development are direct sunlight, in the absence of which only a pale cream color is produced, generally without a tinge of red. Moisture is also an impor-

tant factor in the development of color, and various media were found to influence the color produced by the fungus in a marked degree.

The induction of new species, D. T. MacDougal (*Abs. in Science, n. ser., 23 (1906), No. 585, p. 422*).—The effect of some chemical agents on the development of new species is briefly described in an account of experiments in which the ovaries of Raimannia were stimulated immediately previous to fertilization.

Among the seeds secured were a number which produced plants differing from the normal or typical species, and the series of experiments seems to demonstrate that factors external to the protoplast may exert a profound influence upon the hereditary characters, developing qualities not hitherto exhibited in the parent plants.

FIELD CROPS.

Report of the agriculturist, B. C. Buffum (*Colorado Sta. Rpt. 1901, pp. 20–31, pl. 1*).—A brief report of the work of the agriculturist during the season of 1901 is given. Several varieties of wheat grown for a number of years at altitudes of 7,000 ft. showed a remarkable deterioration when planted at the station. In a field experiment with potatoes, untreated selected clean seed gave the largest yield. The shrinkage of 8 lots of potatoes during 4½ months ranged from 5.2 to 8.5 per cent. Notes are given on a number of varieties of macaroni wheats tested in 1901.

The results obtained with Hanna barley indicated that the variety is well adapted to Colorado conditions. Black oats from Colorado seed gave 71 bu. per acre, North Finnish 60.5 bu., and Silesian 52.4 bu. Three acres of Russian spelt, sown at the rate of 100 lbs. per acre, yielded 181 bu., machine measure. The crop weighed 5,386 lbs., or about 30 lbs. per bushel.

A report of the cooperative grass and forage plants experiments with the U. S. Department of Agriculture at the Colorado Agricultural Experiment Station in 1901, A. H. Danielson (*Colorado Sta. Rpt. 1901, pp. 32–38, pls. 4, dgm. 1*).—The grass garden of the station is described and the species making a good growth, a moderate growth, little growth, or dying out after coming up, and those not germinating are listed and the more important and successful ones briefly noted. The grasses and forage plants under field culture are also briefly discussed.

Succotash as a soiling crop, R. S. Shaw (*Michigan Sta. Bul. 235, pp. 113–127, figs. 4*).—The advantages and disadvantages of several crop mixtures grown for forage from 1903 to 1904, inclusive, are pointed out and notes on their culture and uses are given.

On May 8, 1903, a mixture of 1 pk. of corn, 1 pk. of peas, 1 pk. of oats, and 6 qts. of barley was drilled at the rate of 2½ bu. per acre. The cutting and feeding of this crop to pigs was begun June 24 and lasted 42 days. The yield was at the rate of 22,887 lbs. of green crop per acre. Owing to abundant rainfall, the growth was exceedingly dense and tall. The objection to this mixture was that it did not contain plants making a second growth after cutting.

In 1904 corn, peas, oats, rape, and millet were sown May 7 on two different plats. Pigs were turned in one plat on June 20 and kept there for 32 days. The second growth of rape and millet in this mixture was good.

In 1905 corn, oats, peas, rape, and clover were sown May 1 on one plat and May 20 on another. Floods interfered with the crop, but the data secured from the early sowing showed a yield of green forage of 12.16 tons per acre. Samples taken from 4 representative areas each 2 ft. square showed that these 16 sq. ft. had produced the following number of plants: Oats, 61; peas, 68; rape, 55, and corn 22, their weights being 10.6, 4.2, 2.75, and 0.5 lbs., respectively. The second sowing yielded at the rate of 12.62 tons of green forage per acre and the 4 representative areas, including 16 sq. ft., in this case contained the following number of plants: Corn, 74; peas, 82; oats, 43, and rape 10, the respective weights being 6.9, 1.7, 4.3, and 0.3 lbs. The cutting of this sowing began July 22 and was completed August 11. The composition of samples taken in 1904 and 1905 is recorded.

[**Experiments at the agricultural experiment station at Vienna, 1905**], O. REITMAIR (*Ztschr. Landw. Versuchsw. Oesterr., 9 (1906), No. 3, pp. 148–179*).—The work of the department of agronomy is reviewed and the results secured are briefly reported.

The average results of several fertilizer tests with potatoes, sugar beets, winter rye, and winter wheat show that of the total increase in yield secured from the complete application the following percentages were due to the use of nitrate of soda: Potatoes 48.7, sugar beets 38.2, winter rye 57.5, and winter wheat 40 per cent. The hoed crops received 200 kg. of nitrate per hectare and the cereals 150 kg. These comparatively small applications are regarded in general as the most profitable for the soils under test.

Potash was applied in the form of kainit and potash salt in quantities furnishing 100 kg. of potash per hectare, and the effect of this single application observed for 3 years. The first year the increase in the different crops due to potash was medium and regular, but where kainit was applied to oats no increase was secured. The second year the effect of potash on all crops excepting clover was weak, being weakest with oats. The third year the residual effect was still quite noticeable with clover, where the potash salt showed a better growth than the kainit, while the year before the kainit produced the better crop. The potash requirements of barley did not seem greater than those of other cereals.

Fertilizer experiments on meadows and inoculation experiments with different leguminous plants, together with other work of the station are also reviewed.

Fertilizer experiments on meadows, A. GRETE (*Landw. Jahrb. Schweiz, 20 (1906), No. 2, pp. 117–148*).—The results of cooperative experiments carried on from 1898 to 1900, inclusive, are reported. The plats, each containing 100 square meters, were given various combinations of phosphoric acid, potash, nitrogen, and lime at the rate of 0.8, 1, 0.45, and 2 kg. per plat, respectively. Lime was applied only in 1898.

It was found that the soil was very much in need of phosphoric acid while its potash requirement was small, the yields with phosphoric acid alone being almost as large as where the 2 elements were given together. Nitrogen gave a small increase in the yield of dry matter, but the production of protein was smaller than without it. The increase in dry matter was insufficient to pay for its use. Phosphoric acid and potash favored the growth of clovers and proved most profitable, although the potash added comparatively little to the increase in yield.

Some suggestions relative to alfalfa growing in Ohio, C. G. WILLIAMS (*Ohio Sta. Circ. 49, pp. 3*).—Brief general directions for alfalfa culture are given.

The station found that on soil derived from sandstone the use of a ton of lime per acre was much more effective than other kinds of treatment, while on a limestone soil the application of lime gave no beneficial results. In some plat experiments on a limestone soil the use of 200 lbs. of steamed bone per acre seemed to have increased the yield over 148 per cent, while an application of 8 tons of stable manure per acre apparently gave an increase of 210 per cent.

Alfalfa seed: Its adulterants, substitutes, and impurities and their detection, H. F. ROBERTS and G. F. FREEMAN (*Kansas Sta. Bul. 133, pp. 51–111, figs. 44*).—The impurities commonly occurring in alfalfa seed are enumerated and described, and the results of purity and germination tests made by the station are recorded.

Seed of yellow trefoil (*Medicago lupulina*) was found to be the chief adulterant, but in a number of samples bur clover (*M. denticulata*) and sweet clover (*Melilotus alba*) also occurred. It is pointed out that the seeds of these 3 species, unless present in large quantities, can not be readily distinguished from the seeds of alfalfa. Yellow trefoil and bur clover injure the quality of the forage produced, and on account of their being annuals die out after the first year and thus reduce the stand. Sweet clover is a biennial, and is generally distasteful to stock.

The chief impurity in western alfalfa seed is the dead seed of the alfalfa itself, and the obnoxious weed seeds most commonly present were chiefly those of species of docks and English plantain (*Plantago lanceolata*).

The range of germination in the samples ran from 60 to 96 per cent, with an average of about 83 per cent. The separation of dead alfalfa seed was not found practically possible, and it is recommended that the grading of alfalfa seed be based upon actual germination tests.

Correction of a very unfavorable ratio of lime to magnesia in a soil for the culture of barley, G. Daikuhara (*Bul. Imp. Cent. Agr. Expt. Sta. Japan, 1 (1905), No. 1, pp. 13–16, pl. 1*).—The soil originally contained 0.64 per cent. of calcium oxid and 1.91 per cent of magnesium oxid, representing a ratio of 0.34 : 1. By adding sufficient lime to make the ratio of these two substances 1 : 1 the yield of barley was doubled on well-manured soil, and even more than doubled when the manuring was one-sided or when no application at all was made. This result is attributed not only to the regulation of the ratio of lime to magnesia, but also to the improvement of the physical and chemical condition of the soil resulting from raising the lime content.

Buckwheat, J. L. Stone (*New York Cornell Sta. Bul. 238, pp. 179–193, figs. 5*).—This bulletin gives a general account of the buckwheat plant, with directions for its culture and uses.

An experiment was made by the station in 1901 to determine whether better results could be secured by turning rye under early in the season or by allowing it to grow until shortly before drilling in buckwheat. The results indicated that early plowing and subsequent harrowing to produce a thorough settling of the soil gives the better results. It is recommended that if early plowing is impracticable greater attention should be given to a thorough fitting of the seed bed.

The average yields in a variety test were as follows: Japanese 27.5 bu., Common Gray 26.8 bu., and Silver Hull 19.5 bu. per acre. In cooperative tests by 14 farmers in various parts of the State the average yield of Japanese was 21.29 bu. per acre and that of Silver Hull 20.05 bu.

Buckwheat, E. Haselhoff (*Landw. Vers. Stat., 63 (1906), No. 5–6, pp. 375–406, figs. 11*).—A general description of the buckwheat plant, directions for its culture, a review of experiments conducted with the crop, and a discussion of the chemical composition of the grain, straw, and mill products, together with their feeding value, are given. A bibliography of 17 references is listed.

The cassava industry, L. Colson and L. Chatel (*Culture et industrie du manioc. Paris: A. Challamel, 1906, pp. 95, figs. 7, map 1, dgm. 1*).—This book treats of the culture of cassava on the Island of Réunion, and gives a résumé of the different operations necessary in the manufacture of starch and tapioca. Estimates are given on the cost of production of the crop and the manufactured food materials.

Adulteration of red clover seed, J. Wilson (*U. S. Dept. Agr., Office Sec., Circ. 18, p. 1*).—Of 521 samples of seed of red clover obtained in the open market 116 contained dodder and 5 were found to be adulterated with seed of yellow trefoil. These samples contained from 18.29 to 52.64 per cent of yellow trefoil.

Corn, W. H. Scherffius (*Kentucky Sta. Bul. 122, pp. 155–189, pls. 3*).—A method of selecting seed corn is outlined and a chemical study of the composition of a number of varieties of Kentucky corn is reported. Each variety is described and the results of analyses are given in tables.

These results show that the percentage of nitrogen does not differ materially in the individual whorls of grain on the ear, beginning at the butt, until after the middle is passed, when there is a gradual falling off in the nitrogen content toward the tip. In some instances, however, the grains at the tip contained a higher percentage of nitrogen than the grains in any part of the ear, while in other cases they contained the lowest.

In 3 samples of yellow corn with white-tipped grains scattered about over the ears, possibly due to cross fertilization, there was no material difference in the percentage of nitrogen of the white tipped and the yellow grains. The author concludes that this indicates that there is no change in the nitrogen content from the first year's cross fertilization. Longitudinal rows of grains on opposite sides of the ears gave approximately the same percentage of nitrogen.

Experiments with corn, C. G. WILLIAMS (*Ohio Sta. Circ. 53, pp. 11, dgms. 2*).—The tabulated results of varieties of corn tested for 3 years show that many of them are not adapted to Ohio conditions. Experiments in thick and thin seeding pointed out that the increase in yield was very pronounced up to an average stand of 3.62 plants per hill, the rows being 42 in. apart each way, but that it was accompanied by a decline in average weight per ear, which was especially marked when more than 3 plants were grown per hill.

From field counts made in 63 counties by 328 correspondents it was estimated that the stand of corn in the State for 1905 was 83.6 per cent. The method of conducting an ear-row test plat is described in detail and the total yields of each row of a duplicate test of this kind is shown in a diagram. The yields from the different ears varied from 50 to 115 bu. per acre. Notes are given on a score card for dent corn and on the selection of seed ears.

Cooperative fertilizer experiments with cotton in 1901, 1902, 1903, and 1904, J. F. DUGGAR (*Alabama College Sta. Bul. 131, pp. 17–74*).—In these cooperative experiments the station furnished material and instruction to farmers upon the agreement that the tests be made. The first year 10 reports were received, the second 13, the third 10, and the fourth 21. The conclusions and suggestions are based on these experiments and on earlier work.

The use of acid phosphate was found almost universally beneficial. Kainit, which was less frequently of benefit than acid phosphate, gave its best results where the crop was attacked by black rust. One hundred pounds of this substance per acre was usually found sufficient. The results indicated that on soils containing much clay kainit was unprofitable.

Cotton-seed meal proved to be very effective on all soils except on new land, or on soil rich in vegetable matter. For old lands a mixture of acid phosphate and cotton-seed meal, or of these two substances and kainit, is recommended. A small growth of stalks under favorable conditions of climate and culture is regarded as showing a deficiency of nitrogen in the soil, and a rank growth as indicating that only a small quantity or no nitrogen at all need be applied. The use of phosphates hastened maturity and the freshness of the land reduced the need for nitrogen. After a luxuriant growth of cowpeas or a recent heavy dressing with stable manure or cotton seed, applications of cotton-seed meal were superfluous. Fertilizer formulas for the cotton crop on various kinds of soils in different parts of Alabama are suggested.

The great millet or sorghum in Madras, C. BENSON and C. K. SUBBA RAO (*Dept. Agr. Madras Bul. 55, pp. 122*).—This bulletin gives a popular description of the crop and of the methods of its culture in Madras.

Four-year culture tests with oats, 1901–1904, W. EDLER (*Arb. Deut. Landw. Gesell., 1906, No. 114, pp. 370*).—The individual tests of cooperative experiments for the different years are described and notes are given on the 13 varieties compared. Strube oats gave in general the highest yields of grain, and especially good returns were secured under favorable moisture conditions.

In dry seasons Leutewitz Yellow ranked first in yield of grain, but in seasons with a greater moisture supply several varieties gave better yields. Beseler II succeeded only with a good supply of soil moisture, while Beseler III gave average results for the different years as compared with all the varieties tested. Duppau, Heine Prolific, Heine Trauben, and Anderbeck gave medium yields and were apparently not very readily influenced by weather conditions. Probstei and Fichtelgebirg produced medium yields under unfavorable conditions, but otherwise they were ou

ranked in productiveness by a number of sorts. Beseler I gave the lowest yield of grain, but with Strube ranked first in all years in straw production. Anderbeck and Selchow side oats were also heavy yielders of straw, while Selchow Panicle, Fichtelgebirg, Probstei, and Beseler III stood last in this regard.

A high percentage of grain was produced by Selchow Panicle, Beseler III, Duppau, Leutewitz Yellow, Probstei, and Beseler II, and a low percentage by Selchow side oats and Beseler I. Beseler II, Strube, Anderbeck, Probstei, and Duppau produced the heaviest grain, and Heine Trauben, Fichtelgebirg, Selchow side oats, and especially Leutewitz Yellow, the lightest. The liter weight of the grain varied considerably in different years and was quite irregular. Leutewitz Yellow and Beseler III were lowest in percentage of hull and Beseler II, Strube, and Fichtelgebirg highest.

The grain of Beseler I, Selchow side oats, Anderbeck, and Beseler II was richest in protein, while that of Fichtelgebirg and Leutewitz Yellow was poorest. Selchow side oats and Leutewitz Yellow outranked all other varieties in the fat content of the grain, and Leutewitz Yellow also ranked first in ash content. On the average, Fichtelgebirg ripened earliest, but showed the greatest tendency to lodge. Duppau, Strube, and Heine Prolific stood up well, and Selchow Panicle apparently produced the strongest straw. The Beseler varieties, together with Leutewitz Yellow, Heine Trauben, and Strube, proved quite smut-resistant.

The strong stooling varieties were Fichtelgebirg and Leutewitz Yellow, and the weak stooling sorts Strube, the Beseler varieties, Heine Prolific, and Selchow Panicle. The Beseler varieties produced the longest straw, and Fichtelgebirg, Strube, and Leutewitz Yellow the shortest. Anderbeck, the Beseler oats, and Strube were characterized in comparison with the other varieties by thick stems.

A preliminary report on growing Irish potatoes, C. M. Conner (*Florida Sta. Bul. 82, pp. 387–406, pls. 4*).—A brief discussion of potato culture in Florida is given and the results of experiments in 1905 are tabulated but no conclusions are drawn from the data. The work consisted mainly of fertilizer tests to determine the best sources and the best quantities of the essential plant food elements.

Of different varieties tested Rose No. 4, grown from blossom ends, yielded 215 bu. and grown from stem ends, 225 bu. of marketable potatoes per acre. These were the heaviest yields secured. This same variety grown from Massachusetts seed yielded 160 bu., from Virginia second-crop seed 179 bu., and from seed grown at the station during the previous fall from small potatoes left from the spring crop, 89 bu. per acre.

Some results of potato investigations in 1905, T. C. Johnson ([*Quart.*] *Rpt. W. Va. Bd. Agr., 1 (1906), pp. 41–50*).—Potato culture as carried on in West Virginia in the counties bordering on the Ohio River is described with reference to its extent on the bottom lands along the river, the fertilizer applications and crop rotation, the soil and its preparation, planting and cultivating the crop, harvesting and marketing, and the attacks of fungus diseases.

The principal varieties grown are Early Ohio, Carmen No. 1, Carmen No. 2, Green Mountain, and Sir Walter Raleigh. Experiments in spraying with Bordeaux mixture indicated that this was a profitable operation, a marked gain being shown in the production of the highest grade of tubers. With reference to that part of the crop consisting of small tubers spraying was unprofitable.

A rough skin in its relation to the starch content of potatoes, R. Krzymowski (*Jour. Landw., 54 (1906), No. 1, pp. 57–64*).—Work on this subject by different investigators is reviewed and the author's own results are presented. The rough and smooth skinned tubers of 15 different varieties were analyzed and in 14 cases the rough-skinned tubers were richer in starch. The starch content of the smooth-skinned potatoes ranged from 16 to 19.2 per cent and that of the rough from 17.1 to 21.6 per cent.

On the application of magnesia in the form of magnesium sulphate for the needs of the rice plant, G. Daikuhara (*Bul. Imp. Cent. Agr. Expt. Sta. Japan, 1*

(*1905*), *No. 1, pp. 23–29, pl. 1*).—The results of pot experiments are reported which "show that in the presence of lime as carbonate the necessary amount of magnesia, when applied as crystallized sulphate for paddy rice in sand culture, is so small that the best ratio CaO : MgO becomes 30:1, while in the form of natural carbonates the best ratio would be 1:1 as Aso [E. S. R., 15, p. 1062] had ascertained. This conclusion will hold good also for various sandy soils, while for clayey soils the best ratio $\frac{\text{CaO as carbonate}}{\text{MgO as sulphate}}$ will differ."

Additional experiments, making comparative tests of sodium nitrate and ammonium sulphate, showed that the application of nitrogen as sodium nitrate was not favorable to rice plants, its relative value as compared with ammoniacal nitrogen being as 40 to 100.

The anatomical structure of the stems of spring rye grown on moor soils and its change under the influence of manurial treatment, P. Vageler (*Jour. Landw., 54 (1906), No. 1, pp. 1–30*).—The thickness of the stem wall was found to decrease from the base toward the top of the stem. All parts of the stem not protected by the leaf sheaths showed an evenly developed cuticle, but the epithelium was much strengthened in the upper parts of the stem and in the internodes.

At the lower joints of the internodes the stomata under the leaf sheaths remained inactive and there was practically no development of chlorophyll. The hypoderma was found strongest in the lower parts of the stems and in the internodes. The development of the parenchyma was greatest in the lower portions of the stem and in the upper parts of the internodes. The tissue through which protein is translocated prevailed near the head. The proportion of lumina to cell walls in the stem increased from below toward the spike, corresponding to the lesser strength requirements in the upper portions near the head.

The results of experiments to determine the influence of the fertilizer applications used showed that all manurial treatment, excepting the use of phosphoric acid by itself, tended to increase the size of the stem by enlarging the cell lumina at the expense of the cell walls. The parenchymatic tissue also increased with the quantity of fertilizer applied. Potash, without weakening the stem, favored the production of parenchyma and assimilative tissue and a reduction of unproductive tissue. Its use also resulted in a marked strengthening of the cuticle.

Nitrogen remained indifferent toward the length of the stem and the development of the fibro-vascular bundles, but it reduced the quantity of hypoderma, especially in the lower internodes. This result, coupled with a greater production of chlorophyll in the lower parts of the plant and a reduction in percentage of cell wall, weakens the stem. When nitrogen and potash were applied together the effect of weakening the cell wall was quite marked. Phosphoric acid given in excess produced exceptionally low yields. While acting favorably on the development of the framework of the plant, phosphoric acid reduced the total quantity of cell wall, but when applied with potash and nitrogen it had a strengthening effect on the plant.

Experiments with sugar beet, G. Clarke (*Essex Ed. Com., County Tech. Labs., Chelmsford, 1906, Jan., pp. 22, pl. 1, figs. 3*).—Experiments were conducted at 5 different points. The average yield of sugar beets per acre was 18.3 tons, the percentage of sugar in the beet 16.7, and the purity 84.7. The results with Redtop sugar beet were not included in the average figures just given. This variety gave an average yield of 24.5 tons per acre, with 11.8 per cent of sugar and 79.2 purity.

Seedling canes and manurial experiments at Barbados, 1903–1905, J. P. d'Albuquerque and J. R. Bovell (*Imp. Dept. Agr. West Indies, Pamphlet 40, 1906, pp. 119*).—A summary of part of the work with sugar cane carried on under the direction of the Imperial Department of Agriculture is given.

The varieties of canes were grown on black soils in 12 cases and on red soils in 3. Cane B. 208 again gave good results as plant canes, especially on red soils. B. 147

outranked all the other varieties tested on the black soils. Of the newer varieties B. 1,529 stood second on both black and red soils. The results indicated that the application of nitrogen both to plants and rattoons is profitable. Sulphate of potash was also profitable, but phosphatic fertilizers either had no effect or decreased the yield.

Report on experiments with varieties of swedes, 1902–1905, W. ALLAN (*Edinb. and East of Scot. Col. Agr. Bul. 7, pp. 15*).—Twenty-four varieties of swedes were tested for 4 years. The varieties varied in productiveness and quality, productiveness being more inherent in the variety than quality.

The quality of the crop was influenced by the kind of soil, the size of the roots produced, and the variety grown. Wet and cloudy seasons reduced quality more than quantity. The best producing variety was Premier, which gave on an average fully 1½ tons per acre more than Conqueror, which stood next in the tests. In quality Kinaldie stood first, Stirling Castle second, and New Arctic third.

In the production of dry matter per acre Magnum Bonum and Queen ranked first and second, respectively, with an average difference of ½ cwt. per acre in favor of Magnum Bonum. Next to these varieties in the production of feeding material stood Premier, Paragon, and Stirling Castle.

On the lime factor for the tobacco plant, G. DAIKUHARA (*Bul. Imp. Cent. Agr. Expt. Sta. Japan, 1 (1905), No. 1, pp. 17–22, pls. 3*).—In order to determine the best ratio of lime to magnesia in a soil used for the growth of tobacco a series of pot experiments was made in which ratios of 1, 2, and 4 parts of lime to 1 of magnesia were used. The best results were obtained with a ratio of 4 parts of lime to 1 of magnesia. In all cases the tobacco plants were benefited by the application of lime.

The results of seed tests at the German seed control stations (*Mitt. Deut. Landw. Gesell., 21 (1906), No. 11, pp. 121–123*).—The number of samples tested and the average germination and purity at different seed control stations where this kind of work has been in progress for from 10 to 28 years are given in a table and briefly discussed.

Attention is called to the fact that salable beet seed must come up to the following requirements: A kilogram of beet seed must produce at least 70,000 sprouts in 14 days after planting, and of this number at least 46,000 must be produced in the first 6 days. Of 100 seed balls not less than 75 must have sprouted in this time. The water content of the seed is considered normal up to 15 per cent, inclusive, and up to 17 per cent, inclusive, the seed may still be sold but a deduction in weight for the extra moisture content must be allowed.

Standard seed may contain 3 per cent of foreign matter, but when the content reaches 5 per cent a deduction in weight must be allowed. Over 17 per cent of moisture or more than 5 per cent of foreign matter in a beet sample makes it unmarketable according to the law.

Report of the seed control station at Vienna for 1905, T. VON WEINZIERL (*Ztschr. Landw. Versuchsw. Oesterr., 9 (1906), No. 3, pp. 279–382, pl. 1*).—A review of the work of the station during the 25 years of its existence is given. During this period 200,867 determinations were made.

A list of 83 seed firms cooperating with the station is given, together with a register of the demonstration fields and forage plant and grass seed culture investigations established and in progress since 1898. The work conducted in the Alpine regions from 1890 to 1905 is described and the different investigations carried on in 1905 are noted.

Studies of weeds. I, Some common thistles, J. PERCIVAL (*Jour. Bd. Agr. [London], 12 (1906), No. 12, pp. 705–715, figs. 10*).—The 4 common thistles *Carduus crispus*, *Cnicus lanceolatus*, *C. palustris*, and *C. arvensis* are described and figured and directions for the extermination of each species are given.

HORTICULTURE.

Pineapple culture. III, Fertilizer experiments, H. K. Miller and A. W. Blair (*Florida Sta. Bul. 83, pp. 405–437, pls. 8, dgms. 3*).—This bulletin contains the detailed plan and results of fertilizer experiments with pineapples, extending over a period of 5 years.

The purpose of the experiment was "to find out from what source or sources it is best to obtain fertilizing materials for pineapples; the proper quantity to use for the best results as regards quantity, quality, and shipping properties; best method of applying; ratio of phosphoric acid, nitrogen, and potash; the effect of shading, and to determine any other conditions which will prove of advantage to the industry."

The experiment contained 96 separate plats, with as many variations and combinations of the fertilizers commonly used for this crop. Each plat contained 100 plants and occupied $\frac{1}{150}$ of an acre. All the plats were covered with a lath shed, furnishing $\frac{1}{3}$ shade. Preliminary to the work pineapples were analyzed with reference to the fertilizer constituents contained to determine the proportion in which they exist normally in the plant and fruit. The ratio of the constituents was found to be practically as follows: Phosphoric acid 0.8, nitrogen 1, and potash 2. The results secured on the different sections of the plats are discussed in considerable detail and illustrations given of the plants on many of the different plats.

Acid phosphate was found to have an injurious effect upon pineapples which could be corrected by the use of lime. It is thought that the acid phosphate itself was not the cause of the injury, but rather the sulphate of iron and aluminum which it contained, since acid phosphate derived from bone black did not have any injurious effect on the plants. Since, however, acid phosphate is occasionally colored to represent dissolved bone black, it is recommended that one not experienced in the use of fertilizers should not use any form of acid phosphate whatever for pineapples, but rely upon bone meal or slag.

On the whole the best results have been obtained by the use of about 3,750 lbs. per acre of fertilizer, analyzing 4 per cent available phosphoric acid, 5 per cent nitrogen, and 10 per cent potash, and this formula was perhaps best compounded by the use of bone, blood, and high-grade sulphate.

A number of fruits were analyzed to see if increasing amounts of fertilizer would affect their composition. The results obtained are tabulated, but the data are not considered sufficiently satisfactory to warrant conclusions.

Among the recommendations and conclusions drawn from the whole work, it is shown that as a source of phosphoric acid fine ground steamed bone, bone meal, and slag have given the best results. If acid phosphate is used lime should be added every year or two at the rate of 750 lbs. to the acre. "As sources of nitrogen, dried blood, cotton-seed meal, and castor pomace may be used. Nitrate of soda may be used for the first 6 months and possibly, to a limited extent, for the first year, but after the first year it will probably be safer to eliminate it entirely. Considerable caution is required in its use.

"Of the potash salts used, high and low grade sulphate have given the best results, the latter seeming slightly the better. Muriate has given fair results, though the sulphate undoubtedly gives better results. Kainit should not be used. High-grade tobacco stems, though not used in this experiment, have been used by a number of growers with good results.

"For most of the east coast soils we would recommend 3,500 to 4,000 lbs. to the acre annually of a fertilizer analyzing 4 per cent available phosphoric acid, 5 per cent nitrogen, and 10 per cent potash, to be applied at the rate of four applications a year for the first 18 months, and after this two applications a year; one in February or March, as the conditions may require, and one soon after the removal of the summer crop."

The use of a growing fertilizer on pineapples at the beginning of winter has been found objectionable, since when the plants are started into growth at this time, they are more easily injured by cold weather which may follow in January or February. Ground tobacco stems may be used in the fall, since this material does not cause much growth, but tends to the production, rather, of hardy plants, better able to withstand the cold.

"Within 3 weeks, or as soon as possible after setting out, the plants should have a light application of cotton-seed meal in the bud, about a tablespoonful to the plant. The first regular application should be put on broadcast about 6 weeks later, and be thoroughly worked in with the scuffle hoe." The experiment brought out clearly that when the quantity of fertilizer was increased from a little more than a ton to nearly 2 tons per acre, the number of larger sizes of pineapples was increased to a very profitable extent.

The pineapple crop was injured in 1905 by a frost in February, and some observations were made to determine the relation between the different fertilizers and the frost-resistance of the crop, but no satisfactory conclusions could be drawn.

Pineapple culture. IV, Handling the crop, H. H. Hume (*Florida Sta. Bul. 84, pp. 441–457, pls. 5, fig. 1*).—In the 3 preceding bulletins on this subject, soils, varieties, and results of fertilizer experiments have been considered (E. S. R., 14, p. 459; 15, p. 468; 17, p. 1154). In the present bulletin the author considers the subject of packinghouses and their equipment, field equipment for the harvesting of pineapples, pineapple packages, harvesting, grading, shipping, and marketing fruit with special reference to Florida conditions.

Relative to the picking of pineapples the author states that before reaching full maturity the pineapple is dark, black-green in color and the eyes somewhat pointed and angular. As maturity advances the eyes flatten down somewhat in the center and become slightly elevated around the margins, and the color changes to a very pale green. "The opening and spreading of the crown may be taken as one of the best indications of maturity. . . . As the fruit ripens the stem elongates, the slips grow rapidly and their leaves spread out." In summer fruit intended for short-distance shipments and immediate consumption the basal eyes may be allowed to retain some color. "If considerable time is to elapse between picking and consumption, the fruit should not be quite so mature."

The mango in Hawaii, J. E. Higgins (*Hawaii Sta. Bul. 12, pp. 32, pls. 10*).—A popular treatise on the culture of mangoes in Hawaii. In some experiments made to determine the longevity of mango seeds it was found that of seed 31 to 41 days old, 43.5 per cent germinated and produced good plants. These figures indicate that the seed can be preserved much longer than is generally supposed. An analysis is given of the mango, which shows it to contain 82.51 per cent water, 0.39 per cent ash, 0.01 per cent fat, 1.45 per cent fiber, 0.84 per cent protein, and 14.80 per cent carbohydrates.

Directions are given for the manufacture of chutney, marmalade, and jelly from mangoes, and notes are given on mango breeding, diseases and insects affecting mangoes, varieties of mangoes, and mango seedlings in Hawaii.

Vegetable novelties, F. W. Rane and H. F. Hall (*New Hampshire Sta. Bul. 125, pp. 155–180, figs. 27*).—The results are given of tests of some of the more recent varieties of beans, beets, cabbage, carrots, sweet corn, cucumbers, lettuce, watermelons, pumpkins, squash, potatoes, and tomatoes, with brief descriptive notes. Nitro-culture was used without success in the growing of beans and peas.

Horticultural division, G. S. Scott (*Orange River Colony Dept. Agr., Ann. Rpt., 1 (1904–5), pp. 169–181*).—Notes on a large number of fruits planted at various government forestry stations, and of the growing of certain vegetables, particularly potatoes, on the same area.

Flower biology and productiveness of fruit trees, Ewert (*Landw. Jahrb., 35 (1906), No. 1–2, pp. 259–287, pls. 2*).—Results of extensive experiments are given in which the productiveness of apples and pears, as related to the biology of flowers, was investigated. The special point studied was whether there is anything to fear from the standpoint of self-sterility in making large plantings of a single variety. The following conclusions from the author's work, which extended over a period of 3 years, will show the problems on which data were secured:

Numerous seeds and increased size of fruit accompany each other. Seedless fruits occur not only on such seedless varieties as Vaterapfel and Rihas Seedless, but frequently on trees that usually produce fruit with seeds. Seedless fruits grown on the same tree in competition with seeded fruits are smaller than the latter and frequently misshapen. If foreign pollen is withheld from a tree and only seedless fruits produced, these fruits reach the same size as fruits with seeds. In plantings of a single variety the number of seedless fruits and fruits with but few seeds is relatively high. More fruits with than without seeds are found, however, which indicates that even under such difficult conditions, foreign pollen is carried to the blooms in considerable quantities. Waite's division of fruits into self-fertile and self-sterile sorts requires revision, since fruits may be formed in the absence of pollen.

The experiments which have been made to determine the effect of self-pollination on individual branches of a tree are often of negative value because the enclosing of the blooms results in an unfavorable physiological condition and seedless fruits formed on such branches must compete for nourishment with the seeded fruits on other branches.

There is no basis for the fear that large plantings of a single variety in Germany will result in a decreased yield. The ability of pollen to germinate is variable, but may endure for more than 3 weeks.

Fruits and other food products of Jamaica, E. J. Wortley (*Jamaica: Gleaner Co., Ltd., 1906, pp. 73, pls. 2*).—Brief descriptions and notes are given on the more usual fruits and vegetables grown in Jamaica, as well as such subjects as cloves, coffee, kola, vanilla, sugar cane, etc. The plates show the fruits of all the different plants described.

Influence of colored light on the preservation of ripe fruit (*Mark Lane Express, 94 (1906), No. 3889, p. 399*).—In an article abstracted from the *Bulletin of Agricultural Information*, the results of some experiments are given in which it is shown that ripe fruit can be kept for a longer time under blue glass than under ordinary circumstances. In the experiments cited strawberry plants were grown in pots, and when ripe, part of the pots were placed under red glass and part under blue glass. After a couple of days the fruit under the influence of red light was completely spoiled, while those under blue light kept in good condition for 7 days.

Orchard notes, W. M. Munson (*Maine Sta. Bul. 128, pp. 65–80, pls. 4*).—Under the above heading notes are given on spraying, insects and diseases affecting apples, winter injuries to apple trees, mice injuries, and suggestions given as to pruning trees and handling fruit.

The injuries to apples following the severe winters of 1903–4 and 1904–5 were thought to be due to the overbearing of the trees following a dry season and the very cold winter. Trees which were well cultivated and fertilized started a vigorous growth near the base of the main limbs from which it will be possible to build a new top. In neglected orchards or where the thrifty trees were left in sod, the injured trees continued to deteriorate and many have died. In order to prevent future winter injury it is suggested that the trees be not allowed to overbear.

If tar paper is used to protect trees from mice injuries, it is considered important that the paper be removed in the spring; otherwise there is danger of the tree scalding. The cost of sufficient wire screen to protect 400 young trees was $7.50. The tar paper for an equal number cost 84 cts. Strips of wood veneer, which cost

$5 per thousand, were also used successfully, but in applying them the work must be done before freezing weather comes or many of them will crack and be useless. A still cheaper form of protection is a coat of paint, providing pure materials are used.

An obscure physiological disease of apple trees, apparently due to the excessive use of nitrogenous fertilizers and the lack of available potash, is briefly described.

The apples of New York, II, S. A. Beach, N. O. Booth, and O. M. Taylor (*New York State Sta. Rpt. 1903, pt. 2, pp. IV + 360, pls. 84*).—This volume is similar in make-up to the preceding (E. S. R., 17, p. 559), and is devoted to summer and fall apples which have originated or are grown in New York. It contains an index of the varieties mentioned in the volume, and also a combined index to volumes 1 and 2.

Apple districts of New York with varieties for each, U. P. Hedrick, N. O. Booth, and O. M. Taylor (*New York State Sta. Bul. 275, pp. 61, map 1*).—An alphabetical catalogue is given of the apples that have grown or have originated in New York, in which the characteristics and season of each variety are noted, its suitability for different sections of the State pointed out, and general remarks given on its usefulness.

In addition a discussion is given of the distribution of varieties of apples and the adaptation of groups of apples. Under the latter heading a large number of varieties of apples have been classified into groups, such as Aport Group, Baldwin Group, Early Harvest Group, Fameuse Group, etc. New York State is divided into 9 pomological districts, and lists of varieties which may be successfully cultivated for different purposes given for each. A list of varieties of apples which are unworthy a place among the apples of New York is included in the bulletin, as well as a list of those which have not been sufficiently tested to justify comment on them.

Peach and plum culture, A. B. McKay (*Mississippi Sta. Bul. 93, pp. 16, figs. 3*).—An account of the laying out, planting, and yields of a 9-acre peach orchard, 6 acres of which was planted for commercial purposes with 900 Elberta and 50 Triumph peach trees, and the remaining 3 to numerous varieties of peaches and plums.

The orchard was planted during the first days of January, 1898. In 1899 the trees were severely frozen, so that the bark from the ground to the crotches of the lower branches could be easily pulled away from the tree. They were severely headed back and entirely recovered.

Three crops of peaches have been secured from the commercial orchard. The yield in 1901 was 550 bu.; 1902, 520 bu.; and in 1904, 1,575 bu. The total net returns from the shipment of these fruits to St. Louis, Chicago, and St. Paul were $2,500. The first year the orchard was set out sweet potatoes were grown between the rows, and yielded at the rate of 100 bu. to the acre. The next season peas were planted between the rows, and yielded at the rate of 20 bu. per acre. The total receipts from these crops amounted to $390. The cost of the trees and the expense of preparing the land and planting was $66.75. The care of the orchard is placed at $270, making a total expense of $336.75.

There was, therefore, a profit on the crops grown in the orchard of $53.25, which may be regarded as a good rental value on the land for 3 years, at the end of which time the orchard was ready for fruit-bearing, free from encumbrances. For the next 4 years the average returns from the orchard and fruit were $625, or $104.16 per acre. The annual expense of caring for the orchard during this period is placed at $30, leaving a clear gain of $74.16 for each acre during the 4 years.

Brief descriptions are given of 20 varieties of peaches, and of 7 varieties of plums grown in the experimental orchard. Relative to the fruit produced on different kinds of soil, the author states that trees on the stiff, heavy clay over a light-colored, sticky and poorly drained subsoil made a rather unhealthy growth, a large percentage of the trees died, and the fruit lacked color and flavor. "On the deep, strong clay loam

over an orange-colored clay subsoil the trees have grown rather too vigorously." It has been difficult to keep wood growth within proper limits, but "rather more fruit has set on these trees than in other parts of the orchard."

On light, grayish-colored soil the trees are medium sized, require but little pruning, and produce a fair amount of fruit of good quality, but show signs of nearing the end of their period of usefulness. On red clay over deeper red subsoil "the trees are of medium size, but healthy, well shaped, and require but little pruning. The fruit on this section is invariably more highly colored, freer from defects, more uniform in size and shape, and more highly flavored than that from other parts of the orchard."

Peaches for home and market, W. J. GREEN and F. H. BALLOU (*Ohio Sta. Bul. 170, pp. 157–186, figs. 35*).—Popular directions are given for the culture of peaches, including recommendations as to the soil and its preparation, location, trees, planting, cultivation, fruit thinning, etc., with brief descriptions of 30 of the better sorts.

Varieties of strawberries and cultural directions, O. M. TAYLOR (*New York State Sta. Bul. 276, pp. 63–79*).—The author describes 27 of the standard and newer varieties of strawberries which have been grown at the station, and gives brief cultural directions for strawberries.

In 1905 the season was specially favorable at the station for a good strawberry crop. Fairfield and Weston No. 1 were among the earliest of the desirable kinds. Weston No. 1 produced large fruit of desirable size to the close of the season, but Fairfield appeared to be valuable only on account of its earliness. Among the latest sorts were Cardinal, Mark Hanna, Mead, President, Ridgeway, and Rough Rider. All of these, except Cardinal, produced large fruit of desirable size to the close of the season. The author suggests that the varieties Joe and Mead should be planted closer than other varieties. Mark Hanna was the most productive, though low in quality. President was of largest size and an excellent show berry, but deficient in quality. Mark Hanna yielded at the rate of 12,400 qts. per acre, while Midnight, the least productive variety, produced but 1,114 qts. per acre.

Strawberries, O. M. TAYLOR (*New York State Sta. Bul. 276, popular ed., pp. 8*).—A popular summary of the bulletin noted above.

Marketing strawberries (*Country Gent., 71 (1906), No. 2780, pp. 450, 451*).—An account of a successful cooperative society for marketing strawberries, located at Neosho, Mo., with some details as to methods of marketing and doing business.

Longevity of grapes of various varieties and species in north Texas, T. V. MUNSON (*Texas Farm and Ranch, 25 (1906), No. 7, p. 5*).—The author gives the results of growing 69 varieties and species of grapes for 19 years in Texas, on a light sandy soil from 6 in. to 3 ft. deep and resting on red and yellow clay subsoil. The data are largely given in tabular form. They show the names of each variety, its specific blood, the number of vines of each variety planted 19 years before, number and percentage of vines now alive, degree of profitableness, diseases affecting and present condition of each variety.

The author considers the native Post grape (*Vitis lincecumii*) the most valuable of all American species in many respects. It therefore has been used extensively in hybridizing. The article refutes the statement of H. M. Stringfellow to the effect that the Aestivalis types of grapes are the most reliable in the interior of Texas. The tabular data given show a number of varieties superior to these.

Varieties and species of cultivated cacao, M. A. FAUCHÈRE (*Journ. Agr. Trop., 6 (1906), No. 57, pp. 76–79*).—Brief descriptions of varieties and species of cacao, with an account of their respective uses.

Second report on pecan culture, H. H. HUME (*Florida Sta. Bul. 85, pp. [illegible], pls. 8, figs. 14*).—This is a popular bulletin on the pecan, dealing with its botany and culture in Florida. Such matters as propagation, grafting, nursery growing, top-working, preparation of soils, the planting of the orchard, cultivation, fertilizers in use, methods of pruning, harvesting, marketing, and varieties, are considered in

detail. It is similar in character to the two previous bulletins issued on this same subject (E. S. R., 11, p. 57; 12, p. 559).

Relative to budding the author states that the buds now commonly used are those which have been formed just previous to the time of budding. The recommendations of Oliver (E. S. R., 14, p. 968) that dormant buds of last season be used, has not met with favor in Florida because of the large amount of wood which must be sacrificed to secure a few buds. The best trees for planting in the pecan orchard are well grown 1-year-old trees, from 3 to 5 ft. high. The best time to plant is in the latter part of November to the first of February. The 10 varieties which the author believes worthy of cultivation in Florida are described and notes given on their origin.

All the spireas worth growing, J. DUNBAR (*Gard. Mag. [N. Y.], 3 (1906), No. 4, pp. 206–210, figs. 8*).—Of the 50 species of spireas in cultivation in the United States only 14, in the author's opinion, are worth cultivating, and these belong to two great natural groups, the early bloomers, which are white flowered, and the late bloomers, which are some shade of pink, with two exceptions.

The first group is pruned in June; the second in winter. These 14 species are divided into 5 flowering types, each of which is illustrated. The culture of spireas is given, with descriptions of each species of importance. A systematic key or guide is given to the horticultural value of these species.

The American carnation, A. HEMSLEY (*Gard. Chron., 3. ser., 39 (1906), No. 1002, pp. 145, 146*).—The author states that the introduction of the variety Mrs. T. W. Lawson in England has led to the extensive cultivation of American carnations in England, and that the American varieties are far in advance of the English. A number of varieties are described and methods of cultivation discussed.

Further experiments on inheritance in sweet peas and stocks, W. BATESON, E. R. SAUNDERS, and P. C. PUNNETT (*Proc. Roy. Soc. [London], Ser. B, 77 (1906), No. B 517, pp. 236–238*).—Some of the peculiarities in color inheritance among sweet peas and stocks are pointed out as the result of experimental investigation.

FORESTRY.

The forestry work of the Ohio Experiment Station, W. J. GREEN and C. W. WAID (*Ohio Sta. Circ. 50, pp. 11, figs. 5*).—A considerable amount of cooperative forestry work with farmers is being undertaken. In all 355 plats have been planted to forest trees in different parts of the State under the supervision of the station.

The plan is to give aid to those who wish to help themselves rather than to carry on large forestry operations independently. Some forestry work is being done at the station. In all about 9 acres have been planted to *Catalpa speciosa*, black or yellow locust, Osage orange, white ash, green ash, larch, black walnut, and mulberry. Seedling trees are furnished by the station to farmers without cost.

It is stated that in a catalpa grove 23 years old, the timber value was $326, or $14.17 per acre for each year since planting. In the case of the locust grove 19 years old, the value was $341.76, or $17.98 per acre for each year since planting.

Forest planting in the sand-hill region of Nebraska, G. PINCHOT (*U. S. Dept. Agr., Forest Serv. Circ. 37, pp. 5*).—The results of experiments in growing pine trees on the sand hills of Nebraska seem to indicate that western yellow and jack pine can be successfully used in this region.

The best of the jack pine trees set out on the Bruner plantation in 1890 are now 18 to 30 ft. high. The western yellow pine (bull pine) although not as fast growing as jack pine, is longer lived and is a more valuable tree when matured, and is equally well adapted to the region for planting. Suggestions are given on where to secure planting material and methods of planting. The cost of wild jack pine seedlings is placed at $5 per thousand delivered, and of yellow pine $6 to $15 per thousand. The cost for material and labor is placed at $2.30 per acre.

Review of forest administration in British India, S. EARDLEY-WILMOT (*Rec. Forest Admin. Brit. India, 1903–4, pp. 63, maps 2*).—In addition to the usual data regarding forestry affairs in 1903–4, a 5-year review is given of forestry conditions in India, in which it is shown that the forest area has increased from 81,869 square miles in 1899 to 96,466 square miles in 1904. The working plans at the end of 1904 covered 33,680 square miles. The total cubic feet of timber and fuel cut during this period was 236,016,000. At the same time 214,505,000 bamboos were cut, and the minor forest products amounted to 4,756,000 rupees. The total revenue for the 5-year period was 19,658,000 rupees; the total expenses, 11,269,000 rupees.

Relative to the Imperial Forest School, it is shown that, since its establishment in 1899, 673 students have gone out of the school, of whom 418 are now in government service, 135 in that of native states, etc. The average cost of education per head is 2,606 rupees, without taking into consideration the cost of the buildings.

The appendixes contain the usual data in regard to the forest survey operations, expenditures, receipts, etc. Two large maps of India are given, one showing the distribution of forest lands in India, and the other the forest survey working plans now in operation.

How shall forests be taxed? A. GASKILL (*Forestry and Irrig., 12 (1906), Nos. 3, pp. 119–122; 4, pp. 172–177*).—A paper read before the Society of American Foresters, in which inequitable taxation is held responsible for much of the present forest destruction. Suggestions are given as to the principles which should be applied in the taxation of forests. European systems of taxation are briefly noted.

The author holds that forests should be assessed apart from the land on which they stand, and since they are of public benefit the commonwealth should bear a part of the cost of maintaining them—that is, the State should be made to contribute its share of the cost, as well as the counties in which the forests are located. The greater part of the tax on the forest should fall due when the timber is sold, and the deferred tax should bear a fair relation to the net yield of the property. The owner is entitled to a fair annual return on his investment.

In the enactment of future tax laws relative to forest property, three considerations should enter. "(a) Necessity—the support of the local government; (b) equity—an assessment based upon the actual yield, collection of the tax (on the trees, not on the land) deferred until the crop is sold, and a recognition of the peculiar risks—fire, trespass, etc.—to which forests are subject; (c) encouragement—a special rating of the property to compensate the owner for whatever expense attaches to maintaining the forest in a condition that best serves the public interest."

Kealia forest reserve (*Hawaii. Forester and Agr., 3 (1906), No. 2, pp. 61–68*).—This proposed forest reserve contains 9,935 acres. Its purpose is to protect the natural forest covering the watershed of the northern end of the Puna District of Kauai. A description is given by the superintendent of forestry, R. S. Hosmer, of the lands and forests included.

Ewa forest reserve (*Hawaii. Forester and Agr., 3 (1906), No. 2, pp. 68–79*).—Recommendations, with resolutions relating to the establishment of Ewa forest reserve, are given, with a report by the superintendent of forestry on the area of land included, and an account of the forest. The purpose of the reserve is to insure the continuance of the forest on the Koolau Mountains, and to increase its efficiency as a protection forest by bringing the area under a system of forest administration. The total area of the whole reservation is approximately 28,550 acres.

The black wattle in Hawaii, J. G. SMITH (*Hawaii Sta. Bul. 11, pp. 16, pls. 3*).—The results are given of harvesting a 6-acre grove of Australian black wattle (*Acacia decurrens*) about 13 years old, and directions given for the cultivation and harvesting of this tree in Hawaii. Some data are also given on the influence of climate on the tannin content of black wattle, the production of tan-bark extracts, details of

tanning processes, and suggestions on what to do with the wood. The insect enemies of black wattle in Hawaii are briefly enumerated by D. L. Van Dine.

The wattle appears to thrive best in Hawaii on rather heavy soils at an elevation of 800 to 3,000 ft., where the rainfall ranges from 80 to 150 in. per annum. The 6-acre tract harvested grew on a steep slope at an elevation of 600 to 800 ft. It yielded 38 tons of bark. The 36 tons which were sold brought $839.44, and in addition 500 fence posts and 88 cords of firewood were secured. The firewood was sold for $689.25, making the total value of the tract a little over $1,600. The trees at this time had reached their full development and during the preceding 4 years about 20 per cent of them had died, some because they had reached their limit of growth, and others on account of injury from stock and insects.

Under methods of cultivation, it is stated that 1 lb. of seed will plant 10 acres. Before planting, the seed should be either covered with boiling water and allowed to stand 24 hours, or scorched in hot ashes to soften the hard outside skin to facilitate germination. It is considered more economical to plant the seed in place than to sow in nursery rows and transplant. The trees on good soil should be ready to cut in 10 years. In the station grove trees of the same age varied from 18 in. at the butt, when growing on rich soil with heavy rainfall, to only 6 in. in diameter on rocky thin soil at a lower and drier elevation. Ten-year-old trees should yield at least 100 lbs. of green bark, equal to 50 lbs. of dry bark. It is considered doubtful whether black wattle can be profitably cultivated except on land of fairly good character.

The best bark was obtained by drying under roofs. The main point seems to be to dry in such a manner that the bark will not mold. Where sufficiently large areas are to be harvested, the author believes it would pay to build a large drying house carrying temporary slatted floors 18 in. apart, on which the green bark, cut into lengths of 2 or 3 in., could be uniformly distributed for drying.

In investigating the influence of climate on the tannin content it was found that in the case of koa bark (*Acacia koa*), that taken from trees above Hilo showed 17 per cent tannin, while samples taken from a much drier district showed only 12 per cent. Samples of wattle bark taken from trees growing in a very wet district showed fully as high tannin content as trees growing in a very dry district. The range of tannin in this bark varied from 25 to 36 per cent. No apparent relation was found between the tannin content and the soil or season. The highest yield, therefore, of tannin per acre can be secured from lands on which the trees during the normal growth will produce the largest amount of bark, and this is likely to be obtained where the rainfall is sufficiently heavy to afford the trees uninterrupted growth.

The wood is stated to be hard and tough, and comparable with algeroba in fuel value, but somewhat more difficult to split. It checks in drying. Some suggestions are given on its use in making wood alcohol. It is estimated that 200 acres of ground planted to black wattle would yield 500,000 cu. ft. of wood in 10 years. By distillation this would give a minimum of 1,650 tons of charcoal, 15,000 gal. of wood spirits, 380 tons of acetate of lime, and a large amount of wood tar and creosote, having a total value of $44,000, while the cost of production should not exceed $20,000.

How to prune young locust and catalpa trees, W. J. Green and C. W. Waid (*Ohio Sta. Circ. 51, pp. 6, figs. 3*).—Locust trees are nearly self-pruning. They have a tendency to produce one fork and if this is removed, no attention need be paid to the smaller limbs. With the catalpa the authors recommend the cutting off of the tree to the level of the ground when 2 or 3 years old and allowing but one sprout to develop from the stump. If the trees have made a good root growth, they may be cut back the second year, but if not, pruning should be deferred until the third year. Late winter or early spring is considered the best time for cutting back.

Northern limit of the papaw tree, C. A. WHITE (*Science, n. ser., 23 (1906), No. 593, pp. 749–751*).—A discussion of the distribution in the United States of the papaw (*Asimina triloba*), persimmon, and pecan.

Packing seeds for the Tropics, J. H. HART (*Gard. Chron., 3. ser., 39 (1906), No. 1010, pp. 275, 276*).—The author calls attention to the necessity of packing seeds intended for the Tropics in dry air and in tinfoil packets in order to preserve their ability to germinate. He cites an instance in which English peas imported into Trinidad in ordinary packets gave a 95 per cent germination when first sown. The sowing a month later gave 75 per cent. At the third sowing, 30 days later, the percentage of germination was 40, and at the fourth sowing the percentage of germination was but 20.

Suitability of New South Wales timbers for railway construction (*Indian Forester, 32 (1906), No. 2, pp. 74–77*).—This is a review of the report of the forestry branch of New South Wales for 1904–5.

It appears that the timber area of commercial value in New South Wales is about 20,000,000 acres, or 10 per cent of the area of the State. Up to 1904 about 7,503,200 acres of the forest area had been examined and reserved from sale. The value of the timber exported has risen from $225,145 in 1895 to $794,230 in 1904. Ironbark is used largely for piles, trams, girders, and transoms of bridges because of its strength and durability. Tallowwood, gray and red gum, blackbutt, and Sydney blue gum for decking and light scantling, and turpentine and ironbark for jetty and pier work.

Under favorable conditions ironbark has lasted 40 years as bridge timber, and turpentine piles have been found perfectly sound after standing 40 years in salt water. It is stated that Australian hardwoods last much longer in the track than the timbers commonly used in Europe and North America.

Report on the turpentine industry in the United States, BELL (*Diplo. and Cons. Rpts. [London], Misc. Ser., No. 647, pp. 17*).—A report on the turpentine industry in the United States by the British commercial agent, the data for which are largely based on the reports of the U. S. Department of Agriculture.

DISEASES OF PLANTS.

Notes on miscellaneous diseases, K. MALKOFF (*Ghodishen Otchet Drzhavnata Zeml. Opitna Stantziya Sadovo, 2 (1904), pp. 156–233 [German Summary], pp. 19–22, pls. 3*).—Notes are given on a number of diseases and insect injuries of economic plants.

Among the subjects treated are the spot disease of chick-peas due to *Ascochyta pisi*, which the author says may be controlled with Bordeaux mixture; the control of plum pockets with 3 per cent Bordeaux mixture; combating rose rust with Bordeaux mixture; the brown rot of plums (*Monilia fructigena*); a bacterial disease of mulberries; the use of Paris green, tobacco extracts, etc., against insects; and critical notes on plant diseases observed in Bulgaria in 1904.

Laboratory notes, T. W. KIRK (*New Zeal. Dept. Agr. Ann. Rpt., 13 (1905), pp. 405–428, pls. 19, figs. 5*).—Brief descriptive notes are given on a number of diseases of plants. Among them are a disease of Swedish turnips (*Phoma napo-brassicæ*), apple and pear canker (*Nectria ditissima*), apricot coral spot (*N. cinnabarina*), onion mildew (*Peronospora schleideni*), bean anthracnose (*Colletotrichum lindemuthianum*), broad bean rust (*Uromyces fabæ*), hollyhock rust (*Puccinia malvacearum*), a number of diseases of roses, club root of cabbage (*Plasmodiophora brassicæ*), etc.

Contribution to the life history of some Uredineæ, E. FISCHER (*Centbl. Bakt. [etc.], 2. Abt., 15 (1905), No. 7–8, pp. 227–232*).—Notes are given on *Pucciniastrum padi* and *Puccinia liliacearum*.

Investigations on the stinking smut of wheat and its control, K. MALKOFF (*Ghodishen Otchet Drzhavnata Zeml. Opitna Stantziya Sadovo, 2 (1904), pp. 139–149,*

[*German Summary*], *pp. 12–14*).—The author investigated the effect of time of seeding on smut production, seed treatment with fungicides, and varietal resistance. No striking differences could be noted in the amount of smut that could be attributed to the time of seeding.

In the experiments for seed treatment the effect of hot and cold ashes, dry air, cold water and milk of lime, Bordeaux mixture, hot water, copper sulphate solutions, formalin, and corrosive sublimate solutions were tested. All the treatments reported diminished the germinative ability of the wheat to some extent, the least injury reported being with the lots of seed treated with 0.1 per cent formalin, followed closely by the lot soaked for 5 minutes in Bordeaux mixture. The seed of the different lots was sown and counts made of all smutted stalks and heads.

Practically all smut was prevented by the treatments with Bordeaux mixture, formalin, and 0.5 per cent copper sulphate solution, each treatment being about the same in efficiency. Mixing the grain with dry ashes immediately after thrashing was next in efficiency, only 3.5 per cent of the plants and 2.5 per cent of the heads being smutted.

Marked differences in varietal susceptibility are noted.

Investigations on the mosaic disease of tobacco, F. W. T. Hunger (*Ztschr. Pflanzenkrank., 15 (1905), No. 5, pp. 257–311, fig. 1*).—A review is given of the various theories regarding the cause of the mosaic disease, particular attention being given the bacterial theories of Mayer, Iwanowski (E. S. R., 13, p. 361), and Prillieux and Delacroix (E. S. R., 5, p. 1019), and the theories of Beijerinck (E. S. R., 10, p. 1058), and Woods (E. S. R., 13, p. 146; 14, p. 264), after which the author states and elaborates his theory regarding the causes of this disease.

According to the author's view any disturbances in the normal metabolism of the plant may result in the variegation characteristic of the mosaic disease. He holds that the immediate cause of the disease is an unorganized ferment of the toxophore group of Oppenheimer rather than oxidizing enzyms, as proposed by Woods and others. The mosaic disease must not be confused with variegation as it occurs in ornamental plants, which has been shown to be a not infrequent phenomenon in certain species of Nicotiana. It is also said to differ from the disease described by Sturgis under the name "calico" (E. S. R., 11, p. 755).

Some of the factors favoring the mosaic disease are described and the results of investigations on meteorological conditions and soils in Java are given. A bibliography of literature relating to this subject completes the article.

Combating the mosaic disease of tobacco, H. Jensen (*Centbl. Bakt. [etc.], 2. Abt., 15 (1905), No. 13–14, pp. 440–445*).—In commenting upon the possibility of combating the mosaic disease through breeding experiments, the author briefly describes an experiment which he thinks shows the impossibility of producing resistant races within a single year, as has been claimed by others.

The author believes it will be possible to develop resistant varieties, but that it will be found best to work with resistant races within varieties of known quality, rather than attempt to develop new types whose chief recommendation is hardiness or resistance.

Potato diseases, T. W. Kirk (*New Zeal. Dept. Agr. Ann. Rpt., 13 (1905), pp. 346–363, pls. 6, figs. 2*).—A brief account is given of spraying experiments which successfully reduced the percentage of loss due to various potato diseases, and descriptions are given of the following diseases of potatoes: Late blight (*Phytophthora infestans*), early blight or leaf curl (*Macrosporium solani*), bacteriosis (*Bacillus solanacearum*), scab (*Oospora scabies*), dry rot (*Fusarium oxysporum*), a wet rot which is believed to be of bacterial origin, and brown spot, which is of an uncertain cause. Where known, suggestions are offered of means for preventing these diseases.

Note on the facultative saprophytism of Alternaria solani, A. H. Cockayne (*New Zeal. Dept. Agr. Ann. Rpt., 13 (1905), pp. 428–430*).—A report is given of a

series of experiments with *Alternaria solani* to determine whether it has lost its power of developing saprophytically.

Healthy leaves and leaves infected with *Phytophthora infestans* were inoculated with conidia of *A. solani*, and after developing, the spores were gathered and sown on leaves attacked by the late blight. These infections were repeated for six generations, when the conidia were sown on healthy leaves and kept in a damp chamber. The conidia germinated freely, but the mycelium was poorly developed and no spotting of the leaves resulted, the mycelium appearing to live almost entirely on the surface of the leaves.

It appears that through a space of six generations this fungus, which has become parasitic, was so reduced through gradual adaptation as to be converted into an obligate saprophyte.

Heart rot of beets, mangels, and Swedish turnips (*Jour. Bd. Agr. [London], 12 (1906), No. 10, pp. 596–598, fig. 1*).—A description is given of a disease, attributed to the fungus *Sphærella tabifica*, which is said to be not uncommon in France, where it causes considerable damage to sugar beets. In England the fungus has recently made its appearance, being particularly destructive to mangels and Swedish turnips.

The disease rarely appears before the middle of August, and first attacks the stalks of the largest leaves. Its presence is indicated by the wilting of the leaves, such as follows a hot, dry day; during the night the diseased leaves do not recover, but remain lying on the ground, turn yellow, and decay. Later in the season, when the leaf stalks are dead and dry, a second form of fungus fruit appears on the bleached patches, and some time later the mycelium of the fungus passes into the crown of the root, gradually extending downward. Finally the entire root is reduced to a blackish decayed mass.

The fungus seems to be able to pass the winter in diseased roots left in the field, and where the disease appears, it is recommended that the crop should be harvested immediately and all diseased leaves and roots gathered and burned or deeply buried.

Yellow varieties of mangels appear to be more susceptible to disease than others, as shown by infection experiments.

The drop disease of cabbage, J. Ritzema Bos (*Tijdschr. Plantenziekten, 11 (1905), pp. 105–117, pls. 3*).—A description is given of a disease of cabbage said to be due to *Phoma oleracea*. It has appeared in some of the most important cabbage growing districts of Holland and is proving quite destructive.

Three fungus diseases of the cultivated ginseng, H. S. Reed (*Missouri Sta. Bul. 69, pp. 43–66, figs. 9*).—According to the author, ginseng plantations have increased in number and extent so that ginseng now constitutes an important crop in the State.

The first occurrence of disease on ginseng plants was reported in 1904. At that time the disease seemed to be due to a leaf-spot fungus, and it was thought that spraying with Bordeaux mixture might keep it in check. Later investigations showed that a number of diseases were present and they were not similar to those described from New York (E. S. R., 16, p. 271). On this account the author made a detailed study of the diseases and the fungi causing them. The diseases described are stem anthracnose, leaf anthracnose, and wilt.

The stem anthracnose is due to the fungus *Vermicularia dematium*, and it makes its appearance about 30 days after the plants appear above the ground, producing numerous black scars on the stems of the plants. The stalks are frequently so badly attacked that they break off before the upper portions become wilted. The direct injury is due to the filaments penetrating the cortical and sclerenchyma layers, disintegrating them, and later breaking through the epidermis and forming black spore-producing bodies. This disease can be readily checked by the use of Bordeaux mixture.

The leaf anthracnose, caused by *Pestalozzia funerea*, made its appearance early in July, when black, velvety patches were observed at the bases of the leaves and flower stalks causing them to die and fall off. This form of anthracnose caused the death of thousands of young plants, and it was found that it also could be kept in check by spraying with Bordeaux mixture.

The wilt disease described is due to *Neocosmospora vasinfecta*, and this trouble has proved a very serious one, whole plantations often being destroyed in a single week. As the name suggests, the disease is to be recognized by the wilted appearance of the plants, and in this respect it greatly resembles the wilt of cotton, watermelon, and cowpeas. In fact, the fungus is considered identical with that causing the wilt of those plants.

The author investigated the entrance of the fungus through the roots, but a careful examination failed to show any signs of fungus infection. There was evidence, however, for believing that the fungus enters the plant at the base of the stem through the lesions caused by the stem anthracnose. This is shown from the facts that careful microscopical examination failed to reveal the presence of any fungi in the young parts of the roots, that where as a result of spraying there was no anthracnose fungus the plants were not affected by the wilt, and that the wilt disease never appeared until about 2 months after the stem anthracnose had made its appearance.

The fungus is not found except in the fibrovascular bundles while the plant is alive, while it is very customary to find the spore balls in the interior of dead, hollow stems, etc. The observations of the author have led to the conclusion that the wilt disease can be controlled by keeping the plants free from anthracnose and other fungi which produce lesions on the stems.

A technical account is given of the diseases and of the fungi causing them.

A Phytophthora rot of apples, etc., A. Osterwalder (*Centbl. Bakt.* [*etc.*], *2. Abt.*, *15* (*1905*), *No. 13–14, pp. 435, 440*).—Following a severe rain and hailstorm in June, 1904, apples were found affected with an unusual rot. Upon investigation the cause was determined to be *Phytophthora omnivora*, and inoculation experiments showed the possibility of its causing the rotting of apples and pears within a relatively short time.

Notes on the so-called closed canker of apple trees, K. von Tubeuf (*Naturw. Ztschr. Land u. Forstw.*, *3* (*1905*), *No. 2, pp. 92–94, figs. 2*).—The author describes an unusual form of apple-tree canker, in which the fungus stimulates the tree into the production of large knotty outgrowths. When sawed through, the perethecia of *Nectria ditissima* were found inside the knots.

A bacterial disease of cherry trees, R. Aderhold and W. Ruhland (*Centbl. Bakt.* [*etc.*], *2. Abt.*, *15* (*1905*), *No. 12, pp. 376, 377*).—A preliminary note is given on a bacterial disease of cherry trees that has been quite destructive in some of the Rhine provinces of Germany.

This disease appears to have been hitherto confused with that described as due to the fungus *Valsa leucostoma* (E. S. R., 15, p. 270), but it lacks the characteristic outgrowths of that disease. The organism has been isolated and cultivated, and inoculation experiments show that it is capable of causing the trouble. The bacterium is described by the authors as *Bacillus spongiosus*. The disease is believed to be widely distributed throughout Germany. The authors intend further studies upon it, and suggest that it may also attack other stone and pomaceous fruit trees, as similar appearances have already been noticed on plum and apple trees in the vicinity of Dammkrug.

Observations on the biology of the olive-tubercle organism, E. F. Smith (*Centbl. Bakt.* [*etc.*], *2. Abt.*, *15* (*1905*), *No. 7–8, pp. 198–200, pl. 1*).—The author was led to investigate the organism causing the olive knot (*Bacillus oleæ*), to confirm statements by Schiff (E. S. R., 16, p. 987) relating to the biology of the bacillus.

The organism was isolated from olive knots from California, and studied under various conditions, comparisons being made with organisms plated out from material received from two different sources in Italy. In all of the material examined there

were found to be in addition to *B. oleæ* a number of other organisms. Successful inoculation experiments were made with the organisms from California and Italy.

The author failed to find resemblances between his bacteria and that described by Schiff, and he concludes that no olive knots can be produced with pure cultures of the sporé-bearing organisms described by Schiff.

Investigations on olive tuberculosis, R. Schiff (*Centbl. Bakt. [etc.], 2. Abt., 15 (1905), No. 7–8, pp. 200–211*).—The results of the author's investigations on the cause of the olive tuberculosis and studies on the biology of the organism are given, a preliminary account of which has been noted elsewhere (E. S. R., 16, p. 987).

The occurrence and prevention of gooseberry mildew, R. Ewert (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 5, pp. 200–204*).—Attention is called to the occurrence of *Glœosporium ribis* on gooseberries, the fungus causing serious injury to the plants.

An experiment in preventing the mildew was carried on in which the shrubs were sprayed with ordinary Bordeaux mixture, milk of lime, iron-free Bordeaux mixture, Bordeaux mixture to which varying proportions of iron sulphate were added, and soda Bordeaux. The shrubs were sprayed twice during the season, and the effect as shown on the bushes is described. The author recommends in general the spraying of the shrubs with a 1 per cent solution of ordinary Bordeaux mixture. He also recommends that resistant varieties, as far as possible, be planted, and that they be stimulated to rapid growth by means of cultivation and the use of fertilizers.

The American mildew of gooseberries, J. Ritzema Bos (*Tijdschr. Plantenziekten, 11 (1905), pp. 170–176*).—Notes are given on the gooseberry mildew (*Sphærotheca mors-uvæ*), which has recently appeared in a number of places in Europe, where it seems to be very destructive. The fungus and its effect on the host are described, and suggestions given for its prevention.

Further investigations on the bacterial disease of sesame, K. Malkoff (*Ghodishen Otchet Drzharnata Zeml. Opitna Stantziya Sadovo, 2 (1904), pp. 149–156, [German Summary], pp. 14–19, pls. 5*).—In continuation of a previous note (E. S. R., 16, p. 65) the author gives additional accounts of the biology of the organism causing the wilt of sesame.

The disease is still poorly known but may be recognized by the stems of badly infested plants being wilted and affected with a sort of black rot, while those less seriously attacked are checked in their growth and as a result the crop yield is considerably lowered. Repeated experiments in the isolation and cultivation of the organism and the results of inoculation experiments are described in detail. Field experiments showed that plants from early-sown seed seemed more subject to disease, and moist soils also favored its development. Treating the seed grain with a 0.1 per cent solution of formalin seemed to restrict the spread of the disease in some of the experiments.

Concerning witches brooms of pear trees, F. Muth (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 2, pp. 64–76, figs. 11*).—A description is given of witches brooms occurring on wild pear trees, the outgrowths being attributed to attacks of *Exoascus* sp.

Witches brooms of Quercus rubra, Solereder (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 1, pp. 17–24, fig. 1*).—A description is given of witches brooms found upon the American red oak in a garden at Eriangen, Bavaria.

These growths have previously been reported as occurring on *Quercus ilex*, caused by the fungus *Exoascus kruchii*, and on *Q. lobata*, due to *E. quercus lobatæ*, but the cause of the witches brooms on the red oak is thought to be an entirely distinct species of fungus from those mentioned above. A list is given of trees known to be subject to these growths and, so far as known, the fungi which cause them.

In a subsequent note, by K. von Tubeuf (same journal, No. 7, pp. 309, 310, figs. 2), the occurrence of these growths on red oak in other localities is mentioned.

Witches brooms of fir trees, K. von Tubeuf (*Naturw. Ztschr. Land u. Forstw., 3 (1905,) No. 6, pp. 253–260, figs. 5*).—Illustrated descriptive notes are given on a number of forms of witches brooms observed on fir trees.

Notes on Thelephora laciniata, K. von Tubeuf (*Naturw. Ztschr. Land u. Forstw., 3 (1905), Nos. 2, pp. 91, 92, fig. 1; 4, pp. 187–189, figs. 3*).—Brief accounts are given of attacks of *Thelephora laciniata* on young fir trees. The fungus, while not a true parasite, surrounds the lower parts of the seedling, ultimately causing its destruction. Very small seedlings are especially subject to attack. Moisture favors the development of the fungus. The seedlings should be thinned and stimulated by the use of fertilizers to make rapid growth. The same fungus is reported as injuring one-year-old beech seedlings.

Further studies on Melampsora occurring on willows in Switzerland, O. Schneider (*Centbl. Bakt. [etc.], 2. Abt., 15 (1905), No. 7–8, pp. 232–234*).—The results of inoculation experiments with *Melampsora ribesii-grandifoliæ* and *M. laricireticulatæ* are given, in which notes are presented on the teleutospore and Cæoma stages of the fungi.

The occurrence of timber dry rot in Russia, L. von Lubimoff (*Ztschr. Österr. Ingen. Architekt. Ver., 1905, p. 363; abs. in Centbl. Bakt. [etc.], 2. Abt., 15 (1905), No. 9, pp. 269, 270*).—The rapid extension of railroad building, in which construction timber so largely enters, has served to call attention to the timber dry rot caused by *Merulius lachrymans*. The loss due to this fungus is said to be very great. To prevent its attack various preservatives have been employed, such as carbolineum, creosote, various tar oil and proprietary compounds, corrosive sublimate, etc., and notes are given on their use and relative efficiency.

A sclerotium disease of Forsythia, A. Osterwalder (*Ztschr. Pflanzenkrank., 15 (1905), No. 6, pp. 321–329, pl. 1*).—A description is given of a disease of the ornamental shrubs *Forsythia intermedia* and *F. suspensa* which is attributed to *Sclerotinia libertiana*, and the relation of certain conidia to the fungus is discussed. The stems, leaves, and flowers of the shrubs appear to be subject to attack of the fungus, which has proved quite destructive. The disease has been noticed for several years, but a careful search made in the spring of 1905 failed to show the wintering form of the fungus through the development of germinating sclerotia.

The resistance of various varieties of roses to rust, R. Ewert (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 6, pp. 249–252*).—In 1903 investigations were begun at the Botanical Institute of Proskau on the rose rust due to *Phragmidium subcorticium*, and observations were made on the relative susceptibility of various classes and varieties of roses to the fungus, the observations being extended to cover the years 1903 and 1904.

Except in the hybrid perpetual class there was relatively little disease either year, and during 1904 there was much less than was observed the previous season. The meteorological data show that the rainfall from April to August in 1904 was only about one-third of the amount recorded in the previous year. The results of the observations are tabulated, from which it appears that the hybrid perpetuals as a class are more subject to attacks of *P. subcorticium* than any of the others studied.

A competitive test of spraying apparatus, J. Ritzema Bos (*Tijdschr. Plantenziekten, 11 (1905), pp. 81–96, pls. 2, figs. 8*).—A report is given of the jury designated to award the prizes of the Pomological Society of Holland for hand, knapsack, and power sprayers. The jury in making its award took into consideration the size, weight, apparent durability, cost, relative efficiency, fineness of spray, etc. First and second prizes and honorable mention were awarded in each class.

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Bark ringing by woodpeckers and its relation to forest insects, G. Fuchs (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 8, pp. 317–341, pl. 1, figs. 7*).—It has been shown by various authors that woodpeckers may attack healthy trees making a ring of punctures around the trunk and causing an outgrowth of a shelf-like structure at such points.

It appears that some of the species of woodpeckers are fond of the sap obtained in such outgrowths. It has also been observed that these ring structures may become infested with insects and are visited by woodpeckers in search of food. The author believes that on the whole woodpeckers are of more benefit in the destruction of injurious insects than harm as a result of injury to trees.

The pine squirrel as a forest pest, Rudolf Koch (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 7, pp. 298–303, fig. 1*).—The author presents details regarding the nature of injury to the twigs of pines and fir trees by pine squirrels. The idea that these injuries are more often due to the attacks of *Garrulus glandarius* is without foundation.

The loss of terminal twigs through the agency of pine squirrels, K. von Tubeuf (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 11, pp. 476–478, fig. 1*).—According to observations made by the author all of the terminal twigs of pine trees eaten off by pine squirrels were subsequently replaced by lateral twigs which, however, grow considerably less rapidly than uninjured terminal twigs. The injury from pine squirrels is, therefore, considered as a serious matter.

Cases of bark injury due to the pine squirrel (Sciurus vulgaris), K. Eppner (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 3, pp. 112–120, figs. 3*).—According to the author's observations various species of pine are at times greatly injured by the pine squirrels gnawing off the bark and biting off the terminal branches. Several illustrations of this work of the pine squirrel are given which indicate that the injury from this squirrel may assume a serious character.

The determination of generic types, and a list of roundworm genera, with their original and type species, C. W. Stiles and A. Hassall (*U. S. Dept. Agr., Bur. Anim. Indus. Bul. 79, pp. 150*).—Much confusion has prevailed in zoological literature on account of the uncertainty regarding scientific names and the authors believe that this is partly due to a failure to designate type species for genera at the time of their erection. The discussion presented in this bulletin is designed to prevent, as far as possible, further confusion.

A historical review is given of the principles of type designation, together with copies of the British Association Code, the Dall Code, the code of the American Ornithologists' Union, and of the German Zoological Society, as well as other rules proposed by the various individuals and associations. The principles maintained in the bulletin are illustrated by application to a list of genera of roundworms.

The synonymy of Tænia, T. crassicollis, T. marginata, T. serrata, T. cœnurus, T. serialis, and Echinococcus, C. W. Stiles and E. C. Stevenson (*U. S. Dept. Agr., Bur. Anim. Indus. Bul. 80, pp. 14*).—This bulletin contains a detailed synonymy of species contained in the subgenera Tænia and Taeniarhynchus as well as the species socialis in the genus Multiceps.

International catalogue of scientific literature. N—Zoology (*Internat. Cat. Sci. Lit., 3 (1905), pp. XI + 438*).—The bibliographical references included in this volume are based mainly on literature published in 1903. It includes also certain articles published in 1901 and 1902. The bibliographical titles are grouped according to zoological classification.

The fauna of British India including Ceylon and Burma. Butterflies, I. C. T. Bingham (*London: Taylor & Francis, 1905, pp. XXII + 511, pls. 10, figs. 24*).—This volume is the first of a series of three which are being prepared by the author to

contain information regarding all the butterflies known to occur in British India. This work has been undertaken to supplement and complete that of de Nicéville. In the introduction to the volume the anatomy and classification of butterflies are briefly discussed. The families considered in this volume are Nymphalidæ and Nemeobidæ.

Report of the entomologist, C. P. GILLETTE (*Colorado Sta. Rpt. 1901, pp. 13–18, figs. 10*).—A summary is presented of the work thus far done at the station on codling moth. It appears that the eggs of the spring brood are deposited both on the fruit and leaves. Two applications of Paris green resulted in the saving of 25 to 90 per cent of the apples.

An examination has been made of a large number of bees with reference to the length of the tongue. The author has thus far been unable to find any evidence of a long-tongue race of Italian bees although several so-called long-tongue and red-clover bees have been examined. The length of the tongue in various races of bees ranges from 0.23 to 0.27 in. Brief notes are also given on sugar-beet insects and on a number of miscellaneous insects including Howard's scale, apple aphis, plum gouger, etc.

Dangerous insects and diseases and their treatment, L. R. TAFT (*Mich. Bd. Agr., Nursery and Orchard Insp. Bul. 1, pp. 16*).—The author briefly describes the purpose of the Michigan nursery and orchard inspection law and presents notes on San José scale, European fruit scale, scurfy scale, oyster-shell bark-louse, apple and peach aphis, cankerworm, crown gall, black knot, pear blight, peach yellows, little peach, and methods of fumigating nursery stock.

Insect pests in West Australian orchards and vineyards, F. LOWE (*Jour. Dept. Agr. West. Aust., 12 (1905), Nos. 4, pp. 302–307; 5, pp. 425–432*).—Attention is called to the climatic and other conditions which may exert an influence in determining the prevalence of insect pests and in affecting the relative abundance of parasitic insects. The subject of importation of parasitic insects is also discussed.

Particular attention is given to an account of the habits, life history, and means of combating the codling moth. In spraying for this insect the author recommends the use of Paris green at the rate of 1 oz. in 10 gal. of water to which 8 oz. of lime are added.

A preliminary list of the more injurious insects of Texas, with notes on distribution (*Texas Agr. and Statis. Rpt., 18 (1905), pp. 261–276*).—Some insect pests of the State are listed under the head of the plants which they affect.

Entomological notes, J. KOTINSKY (*Hawaii. Forester and Agr., 3 (1906), No. 1, pp. 8–11*).—Brief notes are given on the use of soap washes in the destruction of scale insects. A soap wash made in the proportion of 1 lb. of soap to 4 gal. of water has been used against the purple scale with satisfactory results in nearly all cases. Recommendations are also made regarding spraying apparatus.

A yearly programme in entomological practice for the orchard, H. A. GOSSARD (*Ohio Sta. Circ. 52, pp. 4*).—Recommendations are made regarding various insecticide operations to be applied in various months to apple, pear, quince, peach, plum, and cherry trees.

Spraying calendar, S. A. BEACH and E. E. LITTLE (*Iowa Sta. Bul. 85, pp. 39–53, figs. 2*).—In an introduction to this bulletin attention was called to the extent of damage caused by insects and fungus diseases in Iowa. The bulletin contains definite recommendations regarding the time for applying various insecticide and fungicide treatments and the materials and formulas to be used. The methods of preparing various spray mixtures are described.

The mealie stalk borer, C. W. MALLY (*Agr. Jour. Cape Good Hope, 27 (1905), No. 2, pp. 159–168, pl. 1*).—*Sesamia fusca* is a regular pest of corn in South Africa. The insect feeds upon corn, Kafir corn, and occasionally on other products. There appear to be only two well defined broods annually.

In controlling this pest it is recommended that old stalks should not be left in the field, but should be burned. In this manner the winter protection for the pest will be removed. Cornstalks may also be plowed under, but this is less effective, since they may not all be buried to a sufficient depth. Losses from the insect in question can not be materially reduced by late planting. A number of parasitic enemies are known, but they are not capable of reducing the number of the pest materially.

The preservation of maize during transport by the Clayton process (*Sci. Amer. Sup., 61 (1906), No. 1571, pp. 25177, 25178, figs. 10*).—Brief notes are given on the various uses of corn and the methods of transporting it from one country to another. In such transportation maize may be attacked by beetles, and for destroying insect pests in corn sulphur fumigation by means of the Clayton apparatus has been found very efficient. The apparatus is suited to disinfection of dwelling houses and other buildings as well as ships. The apparatus in question distributes sulphur dioxid, sulphur trioxid, and other gases through the infested material, and destroys insects in such material.

The control of micro-lepidoptera injurious to grapes in France, J. Dewitz (*Centbl. Bakt. [etc.], 2. Abt., 15 (1905), No. 15–16, pp. 449–467*).—The most important micro-lepidoptera which attack grapes in France are *Tortrix pilleriana, T. ambiguella,* and *Eudemis botrana.*

In treating infested grapes in winter good results have been obtained from spraying with boiling water. Grapevines may also be sprayed with good results by the use of a mixture of lime, coal tar, caustic soda, and carbon bisulphid in water. Some of the insects in the winter stage may be destroyed by scraping the bark from grape trunks or by inclosing the trunks and fumigating with sulphur. Infested trunks may also be sprayed with a mixture of 10 kg. coal tar, 2 kg. oleic acid, 0.5 kg. caustic soda in 90 liters of water. In controlling these pests in summer some success has been had from the use of lantern traps, sticky substances, and various insecticides in weak solutions.

Combating phylloxera in 1904, D. Cavazza (*Ann. Uffic. Prov. Agr. Bologna, 11 (1904), pp. 41–74*).—A meeting was held in Imola at which measures were adopted regarding the control of phylloxera. As a result of this meeting measures were taken to determine the present status of infestation and the results of previous work in controlling the phylloxera. A committee was also appointed to study the distribution of American grape roots in the infested region and measures concerned with the control of the pest.

The grape phylloxera in Hesse, W. Schuster (*Ber. Oberhess. Gesell. Nat. u. Heilk., 34 (1905), pp. 105–127, figs. 2*).—A brief historical statement is given regarding the introduction of the grapevine phylloxera into Hesse and its subsequent distribution. Particular attention is given to a statistical account of the prevalence of this pest from 1878 to 1902.

Natural enemies of the fruit fly, C. P. Lounsbury (*Agr. Jour. Cape Good Hope, 27 (1905), Nos. 3, pp. 309–319; 4, pp. 457–469*).—A visit was made to Brazil for the purpose of investigating fruit flies and their parasites with a view to the importation of possible beneficial parasites. The author and Mr. Fuller spent considerable time studying the conditions of the problem in localities where Mr. Compere had previously worked.

As a result of the investigations it is concluded that the efficiency of natural enemies of the fruit flies found in Brazil has been greatly overestimated by Mr. Compere. The fruit fly *Ceratitis capitata* is a serious pest in various parts of Brazil and appears not to be held in check by its natural enemies. Another serious fruit fly pest is *Anastrepha fraterculu* and is also not greatly affected by natural parasites. The staphylinid beetle reported by Mr. Compere as an important enemy of the fruit fly was not found at all by the author.

In search of parasites, G. COMPERE (*Jour. Dept. Agr. West. Aust., 12 (1905), No. 6, pp. 547, 548*).—A short popular account is given of a recent visit to China in search of the parasites of red scale and purple scale and the announcement is made that in the near future an attempt will be put forth to secure parasites of the potato moth and woolly aphis.

Some tree and wood-infesting insects. Cabbage snakes, H. GARMAN (*Kentucky Sta. Bul. 120, pp. 45–81, pls. 4, figs. 6*).—The elm-leaf beetle has gradually spread over the eastern part of the State, where it has destroyed many neglected elms, particularly the imported species.

The use of bands about the trunks of elms is without effect in keeping the insects away from foliage, but sticky bands or other obstructions may be used for attracting the insects at the time of pupation. In one case more than 13,000 beetles were destroyed in this way about the base of a single tree. Just as effective work, however, may be accomplished by the use of scalding water or kerosene from time to time. The beetles on the foliage may be destroyed by the use of Paris green at the rate of 1 lb. per 100 gal. of water, together with 1 lb. of slaked lime or arsenate of lead at the rate of 3 to 4 lbs. per 100 gal. of water.

Notes are presented on insects affecting oak and other trees. Oaks are attacked by leaf miners and *Kermes pubescens*. The latter may be destroyed by spraying with lime-sulphur-salt wash. Brief accounts are presented of walnut worm, cottonwood leaf beetle, vagabond gall louse, poplar leaf tyer, willow leaf beetle, willow flea beetle, willow slug, apple-tree measuring worm, cicadas, June bugs, and other forest insects.

Considerable injury is reported to casks from the attacks of bark beetles, particularly *Monarthrum fasciatum* and *M. mali*. The wood of vinegar barrels, beer kegs, wine casks, etc., was perforated by small holes which were most numerous near the hoops and at the joints between the staves. Since these insects bore into the wood in hope of finding fungus upon which to live, it is desirable to treat the casks so as to destroy the fungus. For this purpose Bordeaux mixture, copper sulphate, lime-sulphur wash, or bisulphite of lime are useful. The attack of the beetles is largely prevented by scalding the casks and treating them with lime.

On account of the unusual popular interest aroused in cabbage snakes, some attention was given to this subject. The term "cabbage snake" appears to have been applied to a slender species of Mermis which is parasitic in the bodies of a number of insects. In some localities the term has also been used for *Geophilus bipunticeps*.

The black locust tree and its despoliation, C. A. WHITE (*Pop. Sci. Mo., 68 (1906), No. 3, pp. 211–218*).—On account of the fact that the black locust is a rapidly growing tree it has recently been planted on an extensive scale for the production of railroad ties and for other purposes. The author believes, however, that on account of an attack of three especially injurious insects on the plantations, these trees are doomed to failure.

These pests are a leaf miner, gall insect, and the locust borer (*Cyllene robiniæ*). The last-named insect is the most injurious, burrowing through the trunk and larger branches, and rendering the wood unfit for use. Infestation by this pest is not observed at once; in fact the tree may be practically ruined for economic purposes without injury to the bark. The locust borer is exceedingly injurious wherever the black locust occurs in this country except in parts of California. Notes are given on the habits and life history of this pest and on possible remedies.

No effective remedies, however, have been devised. The application of repellent washes to the trunks of trees is suggested, but would be rather expensive.

The root-louse of the Norway spruce, A. JVCOBI (*Tharand. Forstl. Jahrb., 55 (1905), No. 3, pp. 177–197, pl. 1*).—The habits and life history of *Rhizomaria piceæ* are described in considerable detail.

This insect appears on the roots of the Norway spruce, and, when present in large numbers, sucks the juice from the roots to such an extent that the trees are greatly weakened, or, in some cases, killed outright. In combating this pest, the best results have been obtained from the use of carbon bisulphid mixed with molasses and placed in the soil about the roots of infested trees. The molasses serves to hold the carbon bisulphid for some time, allowing it gradually to escape and produce its effect upon the insects. The insecticide may be injected into the soil by means of a syringe or placed in a furrow around the trunk.

The number of annual generations among the bark beetles, E. KNOCHE (*Naturw. Ztschr. Land u. Forstw., 3 (1905), Nos. 9, pp. 353–368; 10, pp. 401–415*).—The literature relating to the biology of various species of bark beetles is critically reviewed.

The author concludes from the study of literature and from his own observations that the question whether a given species of bark beetle produces 1 or 2 generations annually depends not so much upon the species as upon the temperature of the locality where the beetle is found. Nevertheless under given conditions different species do not vary in this respect, but each one shows the same number of generations from year to year.

Tomicus typographus, O. NÜSSLIN (*Naturw. Ztschr. Land u. Forstw., 3 (1905), Nos. 11, pp. 450–468; 12, pp. 481–493, fig. 1*).—This insect is described in its various stages with special notes on its occurrence in Herrenwies and Pfullendorf in 1905. In order to control this beetle it is very desirable that infested trees should be cut and removed from the forest before the beetles have emerged. This and the maintenance of trap trees are about the only practical remedies for the control of the pest.

Pissodes harcyniæ, G. FUCHS (*Naturw. Ztschr. Land u. Forstw., 3 (1905), No. 12, pp. 507, 508, pl. 1*).—This insect is reported as occurring in large numbers in June on pine trees. As a result of the injury due to the beetle, infested trees became subsequently diseased through the attacks of *Trametes pini*.

Lophyrus similis, W. BAER (*Naturw. Ztschr. Land u. Forstw., 4 (1906), No. 2, pp. 84–92, figs. 3*).—This sawfly is described with notes on some related species and on anatomical features which serve to distinguish it from the other species. Particular attention is given to the biological and morphological differences between *L. similis* and *L. pini*.

Progress made in exterminating the fever tick in North Carolina, T. BUTLER (*Raleigh: N. C. Dept. Agr., 1906, pp. 4, figs. 3*).—The attention of cattle raisers is called to the fact that during the past 4 years 10 counties in North Carolina have been freed from cattle ticks and placed above the Federal quarantine line. The author considers that his experiments have demonstrated the feasibility of exterminating cattle ticks in all sections where stock laws prevail. It is believed that the ticks may be exterminated at a smaller cost than the annual loss due to cattle ticks in the affected regions.

Fowl tick experiments, F. H. ROBERTSON (*Jour. Dept. Agr. West. Aust., 12 (1905), No. 6, pp. 561–563*).—It was found that fowl ticks remain alive at least 2 years and 3 months without the presence of any fowls from which to derive nourishment. In these experiments the ticks were maintained in small pill boxes which were practically air tight. In the nymph stage ticks may live for 2 months without food.

A classification of the mosquitoes of North and Middle America, D. W. COQUILLETT (*U. S. Dept. Agr., Bur. Ent. Bul. 11, tech. ser., pp. 31, fig. 1*).—On account of the requests received by this Department from students of entomology, physicians, and sanitary officials regarding the identification of mosquitoes in various parts of the country, the present bulletin is prepared to furnish information along this line. The external anatomy of mosquitoes is briefly described, together with notes on the subfamilies, a table for identifying these subfamilies, and also analytical

tables for the identification of the genera and species of mosquitoes recognized in North and Middle America.

Household insects, W. Lochhead (*Canad. Ent., 38 (1906), No. 3, pp. 65–70, figs. 3*).—Notes are given on the habits and life history of house flies, mosquitoes, fleas, bedbug, carpet beetles, clothes moths, larder beetles, mites in cheese, ham, and flour, flour beetles, meal worms, and red ants. Practical methods of combating these pests are suggested for each species.

Report of the committee on apiary, J. W. Nelson (*Ann. Rpt. Penn. Dept. Agr., 10 (1904), pp. 381–383*).—The winter of 1904 is said to have been one of unusual severity for bees. Notes are given on the quality of honey obtained from various kinds of plants with particular reference to its color and taste. Attention is called to the desirability of a stringent law in Pennsylvania regarding the eradication of foul brood.

Apiculture in Cuba, E. W. Halstead (*Estac. Cent. Agron. Cuba Circ. 20, pp. 11, pls. 3, fig. 1*).—Brief historical notes are given on the development of apiculture in Cuba, the management of bees, artificial swarming, introduction of queens, extraction of honey, foul brood, and other diseases of bees.

Age at which bees first carry pollen, C. C. Miller (*Jour. Dept. Agr. West. Aust., 12 (1905), No. 3, pp. 245, 246*).—The difficulty experienced in determining this matter is considerably increased by the fact that bees so often attempt to rob honey from other colonies and in many instances become confused and enter the wrong hives. The author made a number of observations on this subject and will continue his investigations.

Japan's three silk crops, F. A. Vivanti (*Yokohama: Japan Gazette Press, 1905, pp. 10*).—The great increase in the silk industry in Japan during the past 30 years is attributed by the author to the improved methods which have been adopted, so that three crops of silkworms may be fed annually.

Formerly sericulture was confined almost entirely to the northern provinces of Japan, but now this industry flourishes throughout the islands. The method by which the three crops of silkworms are fed annually is based on the use of cold storage. A large supply of eggs are placed in cold storage in the fall and carried over to the following spring. In May, when the first mulberry leaves appear, about 65 per cent of the eggs are taken out of cold storage and hatched. After about one month one-half of the remaining eggs are in turn taken out and hatched, thus producing the summer crop of cocoons which are ready for reeling in July or August. About a month later, the rest of the eggs are taken from cold storage and hatched, so as to produce the autumn, or third crop.

Streptococcus bombycis in relation to emaciation and flaccidity of the silkworm, S. Sartirana (*Centbl. Bakt. [etc.], 1. Abt., Orig., 40 (1905), No. 2, pp. 207–211; 40 (1906), No. 3, pp. 331–336*).—The author studied the morphology and biology of this micro-organism with special reference to its connection with emaciation in silkworms.

As a result of numerous inoculation experiments, it is concluded that the micro-organism in question must be considered as the only specific cause of this disease. It is found chiefly in the alimentary tract, and causes local lesions, which lead to chronic enteritis. Flaccidity, however, can not be considered as a peculiar disease caused by one micro-organism alone; it is rather a mixed infection due to a number of micro-organisms, including streptococci.

FOODS—HUMAN NUTRITION.

Food and diet in health and disease, R. F. WILLIAMS (*Philadelphia and New York: Lea Bros. & Co., 1906, pp. X+392, fig. 1*).—This volume, which is designed as a text-book for students, has two main divisions, the first treating of food in health and the second of food in disease.

Available data are summarized regarding the chemistry of foods, the physiology of digestion, the changes brought about by cookery, the characteristics of different food groups, feeding in infancy and old age, as well as special diets suited to different diseases, preparation of foods for invalids, and related questions, the volume as a whole constituting a concise summary of the subject of nutrition from the physician's standpoint.

In his introduction the author states that the first half of the volume, which deals with nutrition and food in health, is largely based on the results of the nutrition investigations which have been carried on under the auspices of the Office of Experiment Stations.

A new method of indicating food values, I. FISHER (*Amer. Jour. Physiol., 15 (1906), No. 5, pp. 417–432, figs. 23*).—A system of expressing the nutritive value of food is described in which a quantity yielding 100 calories is selected as the basis for comparison. The author believes that this gives a better idea of the relative nutritive value of different foods than the usual method of expressing percentage composition.

A method is described in which a right-angled triangle is divided in such a way that composition is expressed graphically. The author has devised an instrument by which the nutritive value of a food or diet may be estimated according to his system.

An inquiry into the extent of underfeeding amongst the school children of Blackburn, A. GREENWOOD (*Blackburn, Eng.: Times Printing Works, 1905, pp. 76*).—From a careful study of the existing conditions it is stated that probably not more than 1.3 per cent of the Blackburn school children are underfed. The author believes that "considerable waste occurs in many homes through a lack of knowledge as to cheap nutritious articles of diet and economical cooking. . . . It is important that the elder girl scholars should be taught the preparation and cooking of such meals as are available in a workingman's home."

The function of cellulose in the diet of man, I, H. LOHRISCH (*Ztschr. Physiol. Chem., 47 (1906), No. 2–3, pp. 200–252*).—A large amount of experimental data is reported on the digestibility of cellulose supplied by a number of common food materials.

The results obtained showed that with normal digestive apparatus cellulose is more or less well digested, and indeed under some circumstances is thoroughly digested, the thoroughness of digestion being indirectly proportional to its hardness. On an average the normal subjects studied by the author digested 57.9 per cent of the cellulose, patients suffering from chronic constipation 81.4 per cent, and those suffering from other diseases amounts to considerably less than normal.

The question of cellulose digestion, the author believes, will not be understood until the ferments inducing it, at present unknown, are identified and studied. The article contains a review of earlier investigations and a bibliography.

The influence of the dietary on the constituents of the urine, A. DESGREZ and J. AYRIGNAC (*Compt. Rend. Soc. Biol. [Paris], 60 (1906), No. 18, pp. 616–618*).—The proportion of different constituents of the urine and their relation to each other was studied on an absolute and mixed milk diet, milk and egg diet, vegetarian diet, and mixed diets containing large and small amounts of meat.

The ratio of nitrogen of urea and total nitrogen reached its minimum in the vegetarian diet and its maximum in the absolute milk diet. The ratio of uric acid to urea was greatest on a vegetarian diet and least on a mixed diet containing large

amounts of meat. The phosphoric acid and sulphur constituents of urine were also studied.

The effect on metabolism of overfeeding protein, M. SCHREUER (*Arch. Physiol. [Pflüger], 110 (1905), No. 3–4, pp. 227–253*).—The investigations showed that feeding large quantities of protein did not permanently increase the protein content of the body. An increased oxygen consumption was noticed in experiments with dogs when large amounts of protein were taken, which indicated an increased cell activity, but this increase in the material stored in body cells was not found to be permanent.

Protein feeding and the estimation of glycogen, E. PFLÜGER (*Arch. Physiol. [Pflüger], 111 (1906), No. 7–8, pp. 303–308*).—For exact estimations of glycogen the author insists that his cuprous-oxid method should be used.

Some considerations on proteid diet, L. F. BARKER and B. A. COHOE (*Jour. Biol. Chem., 1 (1906), No. 2–3, pp. 229–238*).—Using Hausmann's method, the amid, melanoidin, diamino, and monamino nitrogen was determined in veal cutlet, pork chop, beef sirloin, beef tenderloin, beef neck, heart, liver, thymus, chicken, and trout, with a view to determining something regarding composition and differences in food value. The various forms of nitrogen were rather evenly distributed in the foods analyzed.

The chemistry of flesh, IV. A study of the proteids of beef flesh, P. F. TROWBRIDGE and H. S. GRINDLEY (*Jour. Amer. Chem. Soc., 28 (1906), No. 4, pp. 469–505*).—The conclusions drawn from an extended chemical study of the proteids of beef flesh were in effect as follows:

The total acidity of aqueous extracts of flesh varies between comparatively wide limits, the minimum being 0.66 per cent, the maximum 1.07 per cent, and the average 0.85 per cent, calculated as lactic acid and expressed in terms of the fresh substance of the meat. The residues of flesh which are left after the complete extraction with cold water are distinctly acid to litmus and to phenolphthalein. On the other hand, the insoluble proteids of flesh upon digestion with decinormal hydrochloric acid at ordinary temperature combine with it and neutralize its acid properties.

Analyses made by the authors show that 13.56 per cent of the total proteid existing in lean beef flesh is soluble in cold water. Of this total soluble proteid 90.04 per cent is in a form which is coagulable by heat from a neutral solution, 8.40 per cent exists as albumoses and a very small quantity apparently exists in the form of peptones. Presumably, the albumoses and peptones do not exist as such in the original flesh. During the coagulation of an aqueous extract of flesh there is an increase in its acidity. Reduction of the acidity of aqueous extracts of flesh facilitates coagulation of the proteids.

There are no well-defined degrees of temperature at which different coagula of aqueous extracts of flesh separate. The complete removal of the proteid coagulating at any fixed definite temperature requires long application of heat. Further, the lower the temperature at which a coagulum is separated, the longer the time of heating required to effect complete coagulation.

The chemical composition of the different fractional coagula of the aqueous extracts of raw flesh is remarkably constant. They are also quite similar as regards their chemical constitution judging from the results of their hydrolysis.

Raw flesh which has been completely freed from proteids soluble in cold water contains two classes of proteid substances, those which are soluble in a 10 per cent solution of ammonium sulphate and those which are insoluble in this medium.

For earlier work see E. S. R., 17, p. 886.

The globulin of muscle fibers, L. MOROCHOWETZ (*Physiol. Russe, 4 (1905), No. 61–67, pp. 42–52*).—A historical account is given of the globulin of lean meat (myoglobin), the chemistry of the subject, and related questions, and the results of studies of preparation, characteristics, and properties reported. According to the author,

if repeatedly dissolved in ammonium-sulphate solution and precipitated with this or some other salt a product is finally obtained which, after dialysis, contains only an inappreciable quantity of ash.

The globulin of egg yolk, L. Morochowetz (*Physiol. Russe, 4 (1905), No. 61–67, pp. 53–59, fig. 1*).—Historical and other data are summarized regarding globulin of egg yolk (vitelloglobin) and studies of its preparation and properties reported. When free from fat and other contaminating bodies, this globulin did not differ from other globulins in respect to its solubility in a solution of common salt or other salts.

The liver as a storehouse for protein, W. Seitz (*Arch. Physiol. [Pflüger], 111 (1906), No. 7–8, pp. 309–334*).—In experiments with chickens the conclusion was reached that protein is stored in the liver.

The effect of constituents of low-grade flour on the extraction of gluten and upon bread-making properties, Lindet and L. Ammann (*Ann. Chim. Analyt., 10 (1905), No. 12, pp. 454–456; 16–17, pp. 1005–1014*).—The difficulty experienced in extracting gluten of low-grade flour, according to the investigations reported, is due to its acidity and to the presence of a mucilaginous substance and of small carbohydrate particles derived from the bran, which become mixed with the gluten particles and prevent agglutination. To facilitate the determination of gluten this bran material should be removed by the action of ferments and the acid and mucilaginous material by extraction with water.

In the second paper, which gives a more extended account of the investigations, the authors conclude that glutenin is made up of fine particles which are not very coherent embedded in a mass of gliadin which imparts the agglutinating properties. The effect of heating at different temperatures and related questions are considered.

The acidity of bread and its causes, H. Stiegeler (*Pure Products, 2 (1906), No. 4, pp. 183–186*).—The acid reaction of bread is due either to free organic acid or to acid potassium phosphate. The formation of acid in flour and leaven, as pointed out, must be attributed to micro-organisms and particularly to bacteria, and a number of sorts of bacteria which produce acid in bread are described.

"When pure yeast is employed in the preparation of the bread, the product exhibits a low acidity; the dough is then so rapidly raised by the growth of the yeast cells and of their fermenting power, that the acid-forming bacteria have no chance to develop. This is the case also with rye bread, whose normally rather high acidity is not derived from the flour. It is the use of impure yeasts, of sour milk and of rancid butter which produces the high acidity in bread leavened with yeast. The acids of bread do not appear to lower its nutritive value, yet a very sour bread will interfere with the digestion of many persons."

The nutritive value of Corsican chestnut flour, P. Comte (*Jour. Pharm. et Chim., 6. ser., 22 (1905), No. 5, pp. 200–210, fig. 1*).—Composition, charateristics, and microscopical structure of Corsican chestnut flour are considered, as well as its nutritive value and place in the diet. According to analyses it contains somewhat less protein and somewhat more nitrogen-free extract than wheat flour. The author considers it a palatable and valuable food product.

Study of apple marc, W. D. Bigelow and H. C. Gore (*Jour. Amer. Chem. Soc., 28 (1906), No. 2, pp. 200–207*).—The data reported show that the hot-water extract, constituting 40 per cent of apple marc, consists of one carbohydrate complex, a galacto-araban.

"The carbohydrate complexes in case of the alcohol precipitate of apple must, and in case of the alcohol precipitate of second pressing ciders, are both higher in galactan, relative to the pentosan content, than the hot-water extracts of apple marc. The treatment with boiling water lessens the yield of crude fiber and cellulose, and at the same time gives a purer fiber and a purer cellulose." (See also E. S. R., 17, p. 465.)

Changes in the composition of the fruit of cucurbits, Leclerc du Sablon (*Compt. Rend. Acad. Sci. [Paris], 140 (1905), pp. 320, 321*).—The sugar, starch, and

water content of different sorts of cucurbit fruits was determined before, during, and after maturity. The sugar, which was abundant in the unripe fruit, diminished during the ripening processes, increased after the fruit was ripe and again diminished. The starch content increased until the fruit was harvested and then diminished, while the water content first increased, then diminished markedly at maturity, and afterwards increased.

The chemistry of celery (Apium graveolens), I, M. Bamberger and A. Landsiedl (*Monatsh. Chem., 25 (1904), pp. 1030–1034; abs. in Ztschr. Untersuch. Nahr. u. Genussmtl., 10 (1905), No. 10, p. 619*).—In the roots of tuberous rooted celery the authors report 0.48 per cent asparagin, and a smaller amount of tyrosin in addition to mannit. Leucin was not found.

The absorption of sulphurous acid from the air by meat, A. Kickton (*Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 6, pp. 324–328*).—The experiments showed that when sulphurous acid was present in air meat would absorb it, the surface containing considerably more than the interior.

Evaporated cream (*Mo. Bul. Bd. Health Mass., n. ser., 1 (1906), No. 3, p. 61*).—Determinations of fat showed that so-called evaporated creams were merely unsweetened condensed milks, having somewhat the consistency and appearance but neither the taste nor physical characteristics of cream.

The artificial coloring of mustard, P. Köpcke (*Pharm. Centralhalle, 46 (1905), p. 293; abs. in Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 6, pp. 349, 350*).—The method of detection suggested depends upon the extraction of the coloring matter with ammonia and showing the presence of artificial coloring matter by dyeing a sample of woolen goods.

Honey vinegar, J. J. Hofmann (*Pharm. Weekbl., 42 (1905), pp. 704, 705; abs. in Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 6, p. 356*).—Honey vinegar is manufactured on a commercial scale in Holland. A number of samples were examined and found to possess an agreeable aroma and taste.

Report of work in the food and drug laboratory, H. E. Barnard and J. N. Hurty (*Mo. Bul. Ind. Bd. Health, 7 (1905), No. 11, pp. 130–144; 8 (1906), No. 1, pp. 5–21*).—Over 50 per cent of the foods, condiments, and beverages examined under the provisions of the State pure food laws were found to be adulterated.

The pure food and drug laws of the State of Indiana (*Mo. Bul. Ind. Bd. Health, 7 (1905), Nos. 7, pp. 75–88; 8, p. 95*).—The legislative enactments regarding pure food and drugs in the State of Indiana and the food and drug rules of the State Board of Health are quoted.

The pure food law in Germany, its origin and growth, and its effect upon the commercial food industry and upon diet, A. Juckenack (*Deut. Vrtljschr. Öffentl. Gsndhtspflege, 37 (1905), pp. 678–688; abs. in Ztschr. Untersuch. Nahr. u. Genussmtl., 11 (1906), No. 6, pp. 358, 359*).—The growth, development, and results of the German pure food law are discussed. In the author's opinion this law is responsible for a great improvement in the quality of food products and in food considered from a sanitary standpoint.

ANIMAL PRODUCTION.

The composition of some Hawaiian feeding stuffs, E. C. Shorey (*Hawaii Sta. Bul. 13, pp. 23*).—Proximate and ash analyses are reported of a number of samples of sorghum, sugar cane tops, millet, Kafir corn, wild and cultivated grasses, alfalfa, wild cowpea, cowpea, 2 sorts of Desmodium, pigweed, sow thistle, *Commelina nudiflora*, *Bidens pilosa*, prickly pear, *Acacia farnesiana*, banana tops and butts, taro tops, sweet potato tops, ti leaves (*Cordyline terminalis*), cassava roots, brewers' grains, molassenit, algeroba beans (whole beans—pods and seeds), rice bran, rice polish, and cocoanut meal. In addition to the usual constituents the percentage of total, proteid, and amid nitrogen was determined.

A fact of special interest brought out by the bulletin is that a number of Hawaiian feeding stuffs, particularly those belonging to the grass family, are deficient in lime, and that the failure to obtain the best results, which has sometimes been noticed with a ration which was apparently well balanced, may be attributed to this cause. In order to secure the best results in bone development, health, etc., the author believes that such feeding stuffs should be supplemented by others richer in lime, as leguminous plants, algeroba beans, and sugarhouse by-products, or by the use of more lime either in the drinking water, mixed with the feeds used, or applied to the soils producing the forage crops.

"While the analyses reported in this bulletin are not considered sufficiently numerous to warrant any extended comparison of Hawaiian feeding stuffs with one another or with those of other regions, or to justify elaborate discussion of the best ways of utilizing the various feeding stuffs in Hawaiian practice, they do show that the Hawaiian feeder has at his command a quite large and varied assortment of feeding stuffs, many of which are of high nutritive value, and it is believed that the information given in the bulletin will aid the feeder in selecting from the feeding stuffs available those which will give him the cheapest and most efficient rations for his stock."

Analysis of fodder plants, E. A. MANN (*Jour. Dept. Agr. West. Aust., 13 (1906), No. 2, pp. 142–145*).—Among the plants analyzed were black boy leaves, grass tree leaves, African wonder grass, and *Eragrostis pilosa*.

Feeding stuff inspection, C. D. WOODS and J. M. BARTLETT (*Maine Sta. Bul. 129, pp. 81–100*).—Under the State feeding stuff law analyses were made of a number of samples of cotton-seed meal, cotton-seed feed, linseed meal, viscid oil meal, gluten meals and feeds, distillers' grains, molasses feeds, mixed and proprietary feeds, corn meal, hominy meal, wheat bran, wheat middlings, mixed wheat feed, oats, beef scrap, and similar goods.

With the exception of samples of cotton-seed meal submitted by jobbers for the purpose of learning their quality, the authors state that they found no cotton-seed meal which was below the Cotton-seed Crushers' Association standard for prime goods.

Inspection of concentrates, J. B. LINDSEY ET AL. (*Massachusetts Sta. Bul. 108, pp. 51*).—The concentrated feeds analyzed under the State law include blood meal, cotton-seed meal, linseed meal, oil meal, viscid oil meal, gluten meal and feed, brewers' and distillers' dried grains, malt sprouts, wheat middlings, mixed wheat feeds, wheat bran, dairy feeds, sugar feeds, rye feeds, buckwheat feeds, calf meal, corn meal, hominy meal, provender, corn and oat feeds, oat feeds, dried beet pulp, corn bran and similar goods, cereal breakfast food by-products, meat scraps and similar goods, dried fish, granulated milk, poultry feeds, and alfalfa and clover meals.

The various corn and oat feeds, the authors state, may be divided into two classes, namely, those consisting largely of oat refuse with some corn, frequently of low quality, and occasionally a little red dog middlings, and those consisting principally of hominy, to which has been added more or less oat offal. The feeding stuffs included in the first class have a rancid, bitter taste, while those in the second group are generally sweet and more attractive. Such goods are inferior to clean, bright corn or hominy meal, yet, as the authors point out, they cost nearly or quite as much.

"Alfalfa [meals], as well as clover meals, are now obtainable for winter feeding. The former should carry 18 per cent protein, and the latter 12 per cent. Preference should be given to bright, clean lots, free from excess of coarse, woody stalks. The price ($1.80 a hundred) is rather in excess of their value. Poultrymen, by raising corn and clover, can considerably reduce their outlay for food. . . .

"Molasses may constitute one-sixth to one-fourth of the grain ration for horses (one pint to one quart daily). A larger quantity tends to make them logy. The same amount may be fed daily as a constituent of the grain ration for dairy stock."

The inspection of feeding stuffs in 1905, F. W. Morse (*New Hampshire Sta. Bul. 124, pp. 147–152*).—Analyses are reported of 84 samples of cotton-seed meal, linseed meal, gluten meal, gluten feed, distillers' grains, hominy feed, compounded cattle foods, vegetable poultry foods, animal meal and similar poultry foods, and bone meal.

The following statements are quoted from the discussion of the analytical data:

"There were found to be 3 distinct classes of cotton-seed meal, according to the percentage of protein, being guaranteed, respectively, to contain 38.5 per cent, 41 per cent, and 43 per cent. . . . The prices were practically alike for all three grades. This is an injustice to the consumer because the lowest grade contains more lint and hulls than the highest grade. The consumer, however, can protect himself by reading the tags on the sacks. . . . Two brands of so-called mixed feed were collected, which were not pure wheat products. One contained corncob and gave an exceptionally high fiber, while the other was made up largely of screenings, finely ground. They complied with the law in bearing proper labels, but one was inferior to its stated composition. . . .

"There are no failures on the part of any of the poultry foods to reach the percentage guaranteed, while some of the animal meats and scraps overrun heavily, especially in fat. Excessive amounts of fat would not seem advantageous for laying hens, however."

Licensed concentrated feeding stuffs, F. W. Woll and G. A. Olson (*Wisconsin Sta. Bul. 134, pp. 17–23, 27–30*).—A list of the feeding stuffs licensed for sale during the calendar year 1906 is given, together with the guaranty of their protein and fat content. The text of the State feeding stuff law is quoted.

The nutritive value of the nonproteid nitrogen compounds in feeding stuffs, E. Schulze (*Jour. Landw., 54 (1906), No. 1, pp. 65–81*).—A summary and discussion of available information concerning the nonproteid constituents of feeding stuffs. The author considers that many of these constituents possess considerable nutritive value, while others are of little or no importance in nutrition. In the latter group, asparagin and perhaps glutamin are included.

Experiments on the value of asparagin and lactic acid in the feeding of Herbivora, O. Kellner (*Verhandl. Gesell. Deut. Naturf. u. Aerzte, 76 (1904), II, 1. Abt., p. 145; abs. in Centbl. Agr. Chem., 35 (1906), No. 1, pp. 45–48*).—From experiments with sheep the conclusion was reached that neither asparagin nor lactic acid bore any part in the gains which were made. The author believes that asparagin has a value in that it tends to prevent the lowering of digestion noted with a very low proteid diet and so acts indirectly and in a limited way as a protector of protein.

Digestion experiments with forage plants, H. G. Knight (*Wyoming Sta. Rpt. 1905, pp. 52–60*).—Experiments on the digestibility of alfalfa hay by sheep gave the following average coefficients: Dry matter, 63.39; protein, 79.67; fat, 41.20; ether extract, 74.08; crude fiber, 44.84, and ash, 56.17 per cent.

Feeding beef cattle in Mississippi, A. Smith and C. I. Bray (*Mississippi Sta. Bul. 92, pp. 24, figs. 10*).—To study the relative merits of feeding in a warm stable and an open yard and to compare a mixed ration of hay and grain with one of cotton-seed meal and hulls only, a feeding test was undertaken with 5 lots of steers. Three of the lots were made up of 5 animals, one of the lots of 7, and one of 3 animals. The cattle in the latter lot were scrubs and the others thrifty animals and medium feeders. Three of the lots were fed in a stable and two in yards, one with and one without an open shed for shelter, the mixed ration and the cotton-seed meal and hull ration being so arranged that each was tested under the 2 conditions of feeding. The test covered approximately 14 weeks.

Considering the thrifty animals fed in stalls the average gain on the mixed ration was 201 lbs. per steer and on the ration made up of cotton-seed products 185 lbs. per steer, the cost of a pound of gain in the 2 cases being 8.5 cts. and 6.1 cts. The scrub

steers fed in a stall made an average gain of 1.0 lbs. at a cost of 10.7 cts. per pound. The steers fed the mixed ration in a yard gained on an average 196 lbs. at a cost of 9.13 cts., and the similar lot fed the ration of cotton-seed products gained 146 lbs. at a cost of 8.2 cts.

The manure may be more readily saved when the steers are fed in stalls. Its estimated value in the test reported was $80.

Following are some of the authors' conclusions:

"The comparison between the stable versus open yard system while showing some advantage in favor of the stable method really indicates that a combination of the best features of both systems is preferable. This could be done by allowing the cattle to run in large sheds with a solid tight floor which should be well bedded, and the manure all saved. If desired, outside yards connected with these sheds could be provided, so that the cattle could have some exercise and plenty of fresh air. One of the secrets of successful cattle feeding is in making them as comfortable as possible.

"Where cotton-seed meal and hulls can be purchased at a reasonable price, they prove to be very cheap feeds for fattening steers. No bad effects result from feeding cotton-seed meal for such short periods as this, and it remains to be seen whether any ration can be compounded exclusive of good silage, which can equal it as an inexpensive feed.

"Dairy farming has many points of superiority over beef raising, but to farmers who are not close to a good market and are handicapped by lack of available and steady labor, the breeding and feeding of cattle will offer many inducements. That it is a profitable business in the South is shown by the low cost of raising cattle, economy in producing suitable feeds, and the inexpensive buildings required. With a good pure-bred beef sire, a herd of native cows, and plenty of pasture land, a farmer may in 2 or 3 years' time develop a good grade beef herd, which will largely increase his profits and maintain the fertility of the soil."

Summary of swine feeding, 1904–5, G. E. Morton (*Wyoming Sta. Rpt. 1905, pp. 44–47*).—Many believe that corn is necessary for pork production, and a comparison of wheat and corn was made with 2 lots of 3 pigs each. In 11 weeks the total gain on wheat was 342 lbs. and on corn 229 lbs.

In a second test wheat and alfalfa hay with and without roots were studied with 2 lots of 2 pigs each. In 13 weeks the lot fed roots gained 183 lbs. and the lot without roots 185 lbs. "Evidently the roots fed did no good in anyway; they were simply an additional expense."

Judging by both tests "straight wheat feeding gives the best gains of any of the rations tabulated, but it also involves very heavy grain feeding [8 to 24 lbs. per day at the end of the test] to get the gain."

"An answer to the question whether this extra gain and less amount of concentrates is offset by the cost of the alfalfa hay depends upon the comparative cost of the feeds in a given locality."

A sow weighing 341 lbs. was fed for 14 weeks beginning December 3, alfalfa hay and roots only, consuming on an average 6 lbs. of the hay and 6 to 24 lbs. of the roots per day. At the end of the period she had lost 7 lbs.

Three sows fed corn, shorts, and alfalfa hay gained 122 lbs. in 6 weeks. "The gain shown . . . is good and the sows were apparently put in good condition for pigging by this ration. One sow gave birth to 7 living pigs and 1 dead pig, the other gave birth to 5 living and 3 dead. Further experimentation will be required to determine whether the ration was responsible for the stillbirths."

Corn and shorts, corn and alfalfa hay, and wheat and corn each with alfalfa hay chopped in swill were compared with 4 lots of 3 pigs each, averaging 65 lbs. each in weight. The gain on corn and shorts 1:2 was 61 lbs., and on corn and alfalfa 1:2, 19 lbs. On each of the rations made up of grain, alfalfa hay, and swill there was a loss

of 3 lbs. "The alfalfa rations for young growing pigs were lamentable failures. The pigs grew scrawny and lost weight."

Supplements to corn for fattening hogs, E. B. FORBES (*Missouri Sta. Bul. 67, pp. 19*).—Using 15 lots of 4 or 5 pigs each concentrated feeds in varying proportions and combinations were compared as supplements to corn meal for dry-lot fattening. Ear corn was also compared with corn meal, both being fed with linseed oil cake.

The tests were made in the winter and covered 29 to 90 days, being preceded by preliminary periods of 4 to 6 weeks. The pigs were confined in small pens with a shed, but were not protected from wind and cold. The grains were ground and mixed to a slop with water except in the comparison of ear corn and ground corn.

When corn meal was supplemented by wheat middlings and linseed meal with and without germ oil meal and gluten meal and feed for 90 days, the gain ranged from 0.971 lb. per head per day on corn meal and wheat middlings 2:1 to 1.430 lbs. on corn meal and linseed meal 5:1, and the grain eaten per pound of gain from 4.45 lbs. on the latter ration to 5.18 lbs. on the former.

When linseed meal and wheat middlings were compared in varying proportions as supplements to corn meal in short periods (29 to 45 days) both the smallest and greatest gains, 1.269 and 1.776 lbs. per head per day, were noted with lots fed corn meal and linseed meal 5:1. The grain required per pound of gain was least with one of these lots being 3.85 lbs. and greatest, 4.75 lbs., with a lot fed corn meal and wheat middlings 2:1.

"The rations of linseed oil meal and corn meal in proportion of 1:5 were eaten in larger quantity than any other feeds tested and made more pork with smaller expenditure of feed than any other ration involved."

The estimated cost of pork made from the oil-meal rations averaged 11.3 per cent less than from the rations of corn meal and wheat middlings.

"Of the three corn products, gluten feed, gluten meal and germ oil meal, the first mentioned seems to be more useful than the others when fed with corn and linseed oil meal. None of them, however, in this combination are as useful as linseed oil meal by itself.

"Gluten meal is richer than gluten feed, differing from it only in lacking the corn bran with which it is ground to make the latter, but it does not seem to be as useful a supplement to corn and oil meal. The ration containing it was not so well relished and was not so efficient. It is possible that the usual recommendation that gluten meal be soaked before feeding to hogs would, if followed, have rendered it more valuable in comparison with gluten feed than it was in this experiment where it was fed immediately after wetting."

In 3 of the tests a mixture of corn meal and cotton-seed meal 8:1 was fed for 51 days. Cotton-seed meal fresh from the factory was fermented at living room temperature for 24 hours previous to feeding, sour milk being used as a starter. It was hoped that this fermentation would render the meal less toxic than it is reputed to be. The cotton-seed meal ration was mixed to a thinner slop than the other rations as it has been claimed that this is a desirable practice. The average daily gain per pig was 0.966 lb. and the grain eaten per pound of gain 4.97 lbs. Three of the 15 pigs included in these tests died at the end of the feeding period. "The gains up to that time had been moderate in extent and cost. The hogs did not relish this feed. A change to the corn and linseed oil meal ration induced much greater consumption of grain, increased the gains in weight 39 per cent and reduced the grain requirement per pound of increase to the extent of 13.1 per cent."

When ear corn and linseed cake 6:1 were compared with corn meal and linseed cake 5:1, the average daily gain per pig on ear corn during the 61 days of the test was 1.004 lbs. and the grain eaten per pound of gain 6.65 lbs. Similar values for the corn meal ration were 1.291 lbs. and 6.05 lbs.

Corn meal and oil cake "fed dry and mixed produced gains in weight with 9 per cent less grain than did ear corn and oil cake fed separately, both dry. The gain in the corn meal lot was 28.6 per cent greater than in the ear corn lot. The hogs receiving ear corn would not eat more than one-sixth as much oil cake as corn (the cob figured out) when both were allowed ad libitum."

In the opinion of the author the severity of the weather had an unfavorable effect on the gains made. The subject is discussed and data summarized regarding the influence of temperature on gains, indicating "that extreme heat of summer and extreme cold of winter act alike to the extent that they both occasion large energy expenditure on the part of the animal, in one case to keep warm, in the other to keep cool; and in either case occasion a great reduction in the profit from feeding in the dry lot when compared with results obtained in spring and fall. These results, however, do not apply to the feeding of hogs on pasture."

The poultry industry in Tasmania, R. J. Terry (*Agr. and Stock Dept. Tasmania, Bul. 7, pp. 15, figs. 4*).—Various questions connected with profitable poultry raising under local conditions are discussed and some experimental data on fattening poultry are briefly reported.

DAIRY FARMING—DAIRYING—AGROTECHNY.

Profitable dairying, C. L. Peck (*New York: Orange Judd Co., 1906, pp. XII + 174, figs. 34*).—This is offered as "a practical guide to successful dairy management," and consists of 23 chapters in which are discussed the physiology of milk secretion, dairy breeds, feeding cows, milking, care of milk, butter making, and similar topics.

Breed, individuality, and heredity in the production of milk, M. Fischer (*Landw. Jahrb., 35 (1906), No. 3, pp. 333–379, pls. 3*).—A study was made of the yield and composition of the milk with particular reference to the casein of 12 cows representing 6 different breeds, and also of 10 cows selected from a large herd with a view to showing the influence of individual characteristics and heredity.

The milk of the mountain breeds including the Brown Swiss and Simmental showed a higher percentage of fat, casein, and solids-not-fat than that of the lowland breeds including the Oldenburg, East Fresian, Angler, and Wilstermarsch. The average annual yield of the latter group, however, was greater, making the annual yield of fat and casein of the 2 groups practically the same. In producing milk for cheese making the Brown Swiss breed is considered especially valuable as compared with the other breeds mentioned.

Within the same breed the author finds in casein production as in fat production marked individual variations. The transmission of individual characteristics is discussed at some length.

A test of a fly repellent, C. H. Eckles (*Missouri Sta. Bul. 68, pp. 35–39*).—The entire dairy herd was sprayed with a fly repellent each morning during alternate periods of 2 weeks each. The test was continued during the entire summer of 1903 and for 6 weeks in the summer of 1904. The yields of milk and fat during the periods when sprayed and when not sprayed are tabulated and show no important effects either upon the yield of milk or fat due to the use of the fly repellent. When applied every morning the material used was fairly effective in protecting the cows from flies, but the claim made that the material will protect cows if applied at intervals of several days is considered erroneous.

Milking machines, P. G. Wicken (*Jour. Dept. Agr. West. Aust., 13 (1906), No. 4, pp. 301–303, pls. 2*).—This is a summary of a report on the use of milking machines in Western Australia, the author concluding that the Lawrence-Kennedy-Gillies machine is now beyond the experimental stage and is working in hundreds of places daily giving practical results.

The composition of milk, H. D. Richmond (*Analyst, 31 (1906), No. 363, pp. 176–180*).—The average composition of 14,828 samples of milk analyzed during 1905

was as follows: Specific gravity, 1.0323; total solids, 12.70 per cent; fat, 3.73 per cent; and solids-not-fat, 8.97 per cent. The average fat content of the morning milk was 3.54 per cent and of the evening milk 3.91 per cent.

Analyses are also reported of 1 sample each of human milk, ass's milk, adulterated cream, a butter adulterant, and a new preservative. The butter adulterant consisted mainly of casein and the new preservative was acid potassium fluorid.

The milk supply of Boston, New York, and Philadelphia, G. M. Whitaker (*U. S. Dept. Agr., Bur. Anim. Indus. Bul. 81, pp. 62, figs. 4*).—In this account of the milk supply of each of the cities mentioned information is given on the magnitude of the business, source of the milk, means of transportation, freight rates, handling the milk in the city, sanitary regulations, and similar topics. Maps are given showing the source of the milk supply of each of the cities.

On the influence of milk control upon the composition of milk in Gratz, K. Helle (*Arch. Hyg., 56 (1906), No. 1–2, pp. 205–207*).—Under the influence of milk control the average fat content of the market milk of this city increased from 2.6 per cent in 1898 to 3.54 per cent in 1905.

The rapidity of the absorption of odors by milk, F. Bordas and Touplain (*Compt. Rend. Acad. Sci. [Paris], 142 (1906), No. 22, pp. 1204, 1205*).—Milk exposed for several minutes in an atmosphere containing formaldehyde in the proportion of 1:100,000 showed clearly a reaction for this substance. The fresher the milk the more rapid was the absorption.

Contribution to the study of the bacterial content of milk and of the udder, R. d'Heil (*Arb. Hyg. Inst. K. Tierärztl. Hochschule Berlin, 1906, No. 7; abs. in Rev. Gén. Lait, 5 (1906), No. 13, p. 306*).—The author finds bacteria regularly present in the milk cistern and ducts and concludes that they gain entrance through the orifice of the teat. Glandular tissue which contains only a small number of bacteria is believed to possess considerable bactericidal power. The higher bacterial content of machine-drawn milk is considered due to the difficulty of cleansing milking machines.

The contamination of milk at the dairy, A. H. Stewart (*Amer. Med., n. ser., 1 (1906), No. 1, pp. 17–21, figs. 9*).—Six experiments are reported which show in a striking manner the value of sterile covered milk pails in lessening the bacterial contamination of milk.

On the frequency of streptococci in milk, M. Kaiser (*Arch. Hyg., 56 (1906), No. 1–2, pp. 51–89*).—Streptococci were found in 76.6 per cent of 30 samples of milk collected in Gratz and vicinity from November, 1904, to July, 1905. The cultural tests are reported in detail.

On the streptococci of milk, P. T. Müller (*Arch. Hyg., 56 (1906), No. 1–2, pp. 90–107*).—Twenty-one cultures of streptococci isolated from pathological products and 22 from milk samples were studied as regards their power of coagulating milk, hemolytic properties, and behavior toward agglutinating serum.

It was found that nearly all of the milk streptococci curdled milk at the end of 24 hours, while very few of the pathogenic streptococci curdled the samples even at the end of 48 hours. All samples in both series, however, were curdled in 72 hours. The more rapid production of acid by the milk streptococci, however, is not considered as showing any specific difference between the two groups of organisms.

In studying the hemolytic power of the various organisms the cultures were divided into 2 series, the first containing those recently isolated, and the second those grown for some weeks in the laboratory. Of the 13 pathogenic streptococci in the first series 7 showed hemolytic properties, and of 10 in the second series 4 were distinctly and 1 slightly hemolytic. Of 10 milk streptococci in each series, 5 in the first and 3 in the second possessed hemolytic properties. The results, therefore, showed no striking difference between the pathological and milk streptococci as regards hemolysis.

In the agglutination tests 7 out of 11 milk streptococci reacted with an immune serum in a dilution of 1:10, while 2 reacted in a dilution of 1:400. Eight out of 9 streptococci of the pathogenic group gave a positive reaction in a dilution of 1:10 and 4 in a dilution of 1:400. The results are interpreted as showing a close relationship between some of the milk streptococci and pathogenic forms, and this was emphasized by the fact that the milk streptococci which reacted with immune serum in high dilutions were the forms which produced hemolysins.

The author, therefore, concludes from the results of his own and other investigations, which are cited, that there can no longer be any doubt that pathogenic streptococci are present in milk. How frequently these are present is a question yet to be answered.

The reduction test as a means of determining the freshness of milk, P. T. Müller (*Arch. Hyg., 56 (1906), No. 1–2, pp. 108–204, figs. 5*).—In making this test in laboratory work the author uses 4 test tubes, in one of which is put 2 cc. of whole milk and in the others equal quantities of milk diluted with water in the proportion 1:2, 1:4, and 1:8. To each tube is added 0.2 cc. of a 0.2 per cent solution of methylene blue, and the liquid after mixing is covered with a layer of liquid paraffin about 2 cm. in thickness. The samples are then placed in a thermostat at 37° C. and the time required for the reduction of the methylene blue in the whole milk is observed.

This test was applied to numerous samples of market milk showing different degrees of acidity; mixtures of fresh and sour milk; dirty milk; milk to which soda, boric acid, salicylic acid, formaldehyde, and hydrogen peroxid had been added; and heated milk.

For fresh milk obtained in a cleanly manner the time required for the reduction of the methylene blue was 10 or more hours, and for milk delivered by producers directly to consumers during cold weather 6½ to 9 hours. The reduction test of milk obtained from small dealers during the forenoons was 5 to 6 hours during cold weather and 1 to 2¾ hours during warm weather, while that of the samples obtained during the afternoons was ¾ to 3 hours during cold weather and ⅓ to 1 hour during warm weather. Milk kept at a high temperature showed a shorter reducing period than milk kept at a low temperature.

Curdled milk reduced the methylene blue in a few minutes. The addition of small quantities of sour milk and also of manure to fresh milk shortened greatly the reducing period. The neutralization of milk with soda was without influence on its reducing properties, but the addition of soda to milk poor in bacteria lessened the time required for reduction until sufficient acid was produced to render the milk again neutral or acid.

The addition of preservatives such as boric acid, salicylic acid, and formaldehyde lessened or destroyed the reducing power of the milk. Milk heated for 15 to 30 minutes at 100° C. showed only a small reducing power, which, however, gradually increased the longer it was kept.

The author describes a modified form of the laboratory method which he considers suitable for household use in determining the freshness of milk. When reduction does not occur at the end of 1 hour the milk is considered suitable for infant feeding.

The testing of market milk, A. Lam (*Chem. Ztg., 30 (1906), No. 39, p. 467*).—This is an abstract of a paper presented before the Sixth International Congress of Applied Chemistry.

In testing market milk in regard to its sanitary condition the author determines what he calls the catalase number. Ten cc. of milk is treated with 5 cc. of a 1-per cent solution of hydrogen peroxid and allowed to stand for 24 hours at a temperature of 22 to 35° C. The number of cubic centimeters of oxygen gas liberated is designated the catalase number. For fresh pure milk this varies between 0.3 and 1. In cases of mastitis or tuberculosis of the udder this number is found to be increased. Milk showing a catalase number of over 3 is considered unfit for use.

The author has also found polarization of the milk serum of value for this purpose. While the normal index of refraction lies between 5 and 5.5, it was found to be 1.2, 1, and 0.73 in the case of diseased animals. The freezing point, however, remained constant.

The care of composite milk samples, I. C. Weld (*New Hampshire Sta. Bul. 126, pp. 181–184, figs. 5*).—Brief notes are given on the taking of composite milk samples and on preserving them with formalin, potassium bichromate, or corrosive sublimate.

On the combination of lactic acid with casein in lactic fermentation, C. Richet (*Compt. Rend. Soc. Biol. [Paris], 60 (1906), No. 14, pp. 650, 651*).—When milk was allowed to coagulate spontaneously the curd was found to fix about 5 times the amount of lactic acid contained in the same volume of whey.

A test of tin can separators, C. H. Eckles (*Missouri Sta. Bul. 68, pp. 23–34, figs. 4*).—Tests were made of 3 forms of so-called separators which consist of 2 cans one within the other. The milk is placed in the inner can and cold water in the outer can surrounding the milk.

The average results of 42 trials with these cans showed that the skim milk contained 1.39 per cent of fat, equivalent to a loss of 22.56 per cent of the fat. The 3 patented cans were compared with shallow pans, a dilution can, the centrifugal separator, and a homemade can. Under the conditions of the comparison the shallow pans gave better results than either the dilution or double cans. The homemade can costing $1.50 gave equally good results as the patented cans costing from $6 to $10.

Creamery problems, C. L. Beach (*Connecticut Storrs Sta. Bul. 40, pp. 38–47*).—Of 1,362 patrons of 18 creameries in 1903, 256, or 19 per cent, were using centrifugal separators, while the remainder were using the Cooley system of cream raising. Comparative tests were made of these 2 methods.

The average of 13 samples of skim milk by the Cooley system showed the presence of 0.27 per cent of fat, and the average of 36 samples of separator skim milk showed the presence of 0.056 per cent. It is estimated that with a herd of 10 cows the hand separator effects a saving of $25.48. Five types of centrifugal separators were compared, the fat content of the skim milk ranging from 0.038 to 0.076, which difference for a herd of 28 cows is estimated as equivalent to $7.95 for one year.

The fat content of 10 samples of skim milk was determined by gravimetric analysis and by the Babcock test, using 17.6 cc. and 25 cc. of acid. The average results for the 3 methods were, respectively, 0.144, 0.046, and 0.063 per cent. Even with the excess of acid the Babcock readings were much lower than the gravimetric determinations.

Readings of Babcock tests were made at temperatures of 130 and 180° F., the average difference on 10 samples being 0.42 per cent. This emphasizes the importance of making the readings at a uniform temperature.

Variations in the weight of 18 cc. of cream containing different percentages of fat are given in tabular form to show the importance of weighing samples.

In 14 experiments a starter made from a pure culture was compared with a skim milk starter. The average score of the butter from the 14 churnings when the pure culture starters were used was 94 and of the butter from the churnings ripened with skim milk starters 94.1. A table shows the bacterial content of 12 samples of butter, of the cream from which the butter was made, and of the starter used in ripening the cream.

Creamery cold storage, J. A. Ruddick (*Canada Dept. Agr., Dairy Comr. Branch Bul. 10, pp. 14, pls. 2*).—This furnishes information on the subject of creamery cold storage and embodies the results of recent experiments conducted for the purpose of testing various materials used for the purpose of insulation. Specifications are given

for the construction of creamery refrigerators on both the air circulation and cylinder systems.

The manufacture of whey butter at Swiss cheese factories, E. H. FARRINGTON (*Wisconsin Sta. Bul. 132, pp. 32, figs. 17*).—This bulletin, which is published in both English and German, contains descriptions of the methods employed in making whey butter in Swiss cheese factories in Wisconsin, with suggestions for the improvement of these methods.

The cold process of skimming the whey is considered not only wasteful but unsatisfactory on account of the extremely sour condition in which the whey is returned to the farmers, and also because the cream so obtained is not suitable for the manufacture of good butter. It is believed that this method should be abandoned. The hot process is considered much superior to the cold skimming in that much more fat is recovered and the cream is in a sweet condition, making it possible to produce butter of good flavor.

About 2 years ago some experiments were made in cooperation with the University of Wisconsin dairy school in skimming whey with a centrifugal separator, and since then this method has been tried on a practical scale in connection with a large number of factories. According to the author's observations centrifugal separation in a thermal cream separator is superior to the other methods. The separator removes nearly all of the fat, and the blue in the skim milk permits the making of butter equal in quality and water content to cream. The objections made to installing separators in cheese factories are the loss of skim milk; milk heating; and expense for power. Results have shown, however, that with improved methods of skimming and churning the surplus whey butter may more than pay for the additional cost.

In addition to the separator there is needed in the Swiss cheese factories, according to the author, a cream vat of some sort in which the whey cream may be ripened and cooled before churning and improved methods of working the butter.

The suggestions made for improving whey butter cover skimming the whey, ripening the cream, making and using a starter, churning the cream, working the butter, and other topics.

Some facts about moisture and its effects on butter, G. L. MCKAY (*Hoard's Dairyman, 37 (1906), No. 16, pp. 432, 433*).—In discussing this subject the author gives data obtained at the Iowa station and observations made abroad.

It is not believed that the poor keeping quality of butter is due to an excess of moisture so much as to unsanitary methods pursued and the use of overripe cream. The author considers that "there is no danger of any maker incorporating too much water who churns his butter in a granular condition and does not resort to abnormal methods, such as churning at high temperatures, washing with warm water, overchurning, or working the butter in water."

On the composition of Dutch butter made in the creameries placed under State control, T. VAN SILLEVOLDT (*Gen. Dir. Agr. Min. Agr., Indus. and Trade [Netherlands], [Circ.], 1905, No. 5, pp. 31; 1906, Jan., Feb., Mar., Apr., pp. 4 each*).—Of 4,340 samples of butter analyzed during October, November, and December, 1905, 78 showed a lower Reichert-Meissl number than 24. The analytical results are hereafter to be published monthly, with a special report every 6 months on the samples showing low Reichert-Meissl numbers.

Bacteriological examinations of the butter of Stuttgart, A. REITZ (*Arch. Hyg., 57 (1906), No. 1, pp. 1–28, figs. 5*).—This is a detailed report of the inoculation experiments with guinea pigs made to determine the presence of tubercle bacilli in butter, previously noted from another source (E. S. R., 17, p. 1109). Tubercle bacilli were present in 8.5 per cent of the samples.

Fungi in cheese ripening: Camembert and Roquefort, C. THOM (*U. S. Dept. Agr., Bur. Anim. Indus. Bul. 82, pp. 39, figs. 3*).—This reports in detail the mycological studies referred to in the previous bulletin (E. S. R., 17, p. 79) on the manufacture of Camembert cheese in the United States.

In the manufacture of soft cheese of the Camembert type the curd is rendered acid by the action of lactic-acid bacteria, and later alkaline by the growth of various species of fungi which, through the production of enzyms, break down the curd to a greater or less extent.

"The Camembert Penicillium (*P. camemberti*) is the only species so far studied with which the particular appearance and texture sought in the ripened Camembert can be produced from curd soured by lactic bacteria without producing any objectionable flavor.

"*Oïdium lactis* is always found upon Camembert cheese and so closely associated with the presence of the flavor as to indicate its agency in flavor production, though only circumstantial proof of such function has been possible thus far. The participation of bacteria in flavor production is not excluded by these results.

"Other species of fungi have been shown to produce variations in this flavor such as have been often found in certain market cheeses."

The Roquefort Penicillium (*P. roqueforti*) is the only fungus found necessary to produce the typical flavor of Roquefort cheese. This mold has also been found in imported Stilton, Gorgonzola, and Brinse cheese as well as in the Roquefort.

Oïdium lactis is the only fungus which has been found regularly upon Limburger, American Brie, Isigny, and related types of cheese.

Technical descriptions are given of the 2 forms of Penicillium under the new names *P. camemberti* and *P. roqueforti* and of *Oïdium lactis*.

A new method of making dry red wine, F. T. Bioletti (*California Sta. Bul. 177, pp. 36, figs. 14*).—Wine-making experiments during the year have abundantly verified, according to the author, the claims made for the method given in Bulletin 167 of the station (E. S. R., 17, p. 183).

"The most important conclusion to be drawn from these experiments is that sound dry wine of fair quality can be produced in the upper San Joaquin Valley and similar regions from the varieties of grapes growing there, simply by ordinary attention to cleanliness, the sterilization of cooperage, and more than ordinary attention to the control of temperature.

"For white wines a thorough preliminary defecation of the must by means of sulphur fumes and the use of pure yeast or yeast starters is advisable.

"For red wines some form of cooling machine is essential, and the temperature of the fermenting wine should never exceed 95° F., and if possible should be kept below 92° F. This can be easily and perfectly done by means of the cooling machine described in Bulletin No. 174 (E. S. R., 17, p. 1110).

"The grapes both for white and red wines should be thoroughly ripe. Ripeness must be determined by the flavor and appearance of the grapes more than by the amount of sugar they contain. We can not hope to get the best results from imperfectly ripe grapes even if they contain 22 per cent of sugar. Some varieties in the climate of the San Joaquin Valley are not perfectly mature for wine-making purposes until they contain 25 per cent of sugar or more. Better results are to be obtained by diluting and, if necessary, adding tartaric or citric acid to over-ripe grapes in this region than by attempting to make wine from under-ripe grapes which have not developed the color, body, and flavor necessary for the production of good wine."

The cost of applying this method on a large scale is yet to be ascertained, and with this in view a plan is given of a cellar suitable for working 50 tons of red grapes per day along with an outline of the method of operation.

The artificial ripening of grapes, L. Mathieu (*Rev. Vit., 25 (1906), No. 640, pp. 313–316*).—The results are given of an experiment in which wine was made from grapes partially dried in an evaporator. The work shows that it is possible to partially evaporate grapes in order to concentrate the must without any injurious effects or cooked taste to the wine. The process favors the production of a wine of superior quality.

VETERINARY MEDICINE.

Proceedings of the American Veterinary Medical Association (*Proc. Amer. Vet. Med. Assoc., 42 (1905), pp. 506, pls. 20*).—This volume contains an account of the meeting of the forty-second annual convention of the American Veterinary Medical Association, held in Cleveland, Ohio, August 15–18, 1905.

As usual, in the proceedings lists are given of the officers, committees, resident secretaries, and honorary and active members of the society. The address of welcome was given by the mayor of Cleveland, T. L. Johnson, and was responded to by R. R. Bell. The president's address, by M. E. Knowles, contained references to various veterinary matters, particularly to the cooperation of veterinarians and physicians and the importance of the veterinarian in the promotion of general sanitation.

In the reports of resident State secretaries attention is called to the condition of health in domesticated animals in the various States and Territories. In Arizona and New Mexico, particular attention was given during the year to sheep scab; in Colorado to cattle mange, loco weed, and bovine tuberculosis; in Connecticut, Cuba, and Porto Rico, to the legislative control of animal diseases; in Maine, to tuberculosis and glanders; in Maryland, to anthrax and forage poisoning; in Michigan, to rabies; in Minnesota, to hemorrhagic septicemia and swamp fever; in Mississippi, to anthrax and Texas fever; in Nebraska, to various parasitic diseases; in Ohio, to tuberculosis and swine plague; in Ontario, to actinobacillosis and hog cholera; in Pennsylvania, to legislation regarding experimental veterinary work; in the Philippines, to surra, rinderpest, and foot-and-mouth disease; in Tennessee, to glanders and influenza; in Texas, to Texas fever and cattle mange; in Vermont, to anthrax and glanders; and in Wisconsin, to the present status of the veterinary practitioner.

The Report of the Committee on Intelligence and Education, by C. J. Marshall et al., contains a general review of matters of interest to veterinarians, a digest of recent veterinary literature, and a detailed account of the quality of instruction and the curricula in various veterinary schools in this country.

In the report of the Committee on Diseases, by C. H. Higgins et al., attention is devoted to methods of keeping the clinical history of cases, the need of more veterinary research work, and the discussion of rabies, *Bacillus necrophorus*, roup in chickens, and the State control of tuberculosis. The present status of the movement for securing legislation regarding army veterinarians was presented by a committee consisting of W. H. Lowe et al.

An unusual number of papers were read at the various meetings of the convention and are printed in the proceedings. It is impossible to refer to these except in the briefest manner. The Artificial Immunization of Cattle Against Tuberculosis was discussed by L. Pearson and S. H. Gilliland. The authors report considerable success in the use of various vaccinating methods and believe that these methods promise to become much more effective. Papers were also presented on The Pathology of Tuberculosis, by C. Schulin, and by R. H. Harrison on Unusual Lesions of Tuberculosis Found in Abattoir Inspection. The method of controlling glanders adopted by a French firm which employs a large number of horses was discussed in a paper by E. Lavalard. The method consists in the general use of mallein, furnishing as favorable conditions as possible for suspected horses in quarantine, and the exercise of great care in introducing strange horses into a healthy herd.

The Spavin Group of Lamenesses was discussed by W. L. Williams et al. This account is one of the most important thus far published on the general subject of spavin and enters, in great detail, into the pathology, peculiar forms, etiology, and treatment of the disease by different methods.

Mention should also be made of the following papers: The Clinical Examination of the Blood of the Dog, by S. H. Burnett and J. Traum; Cultivation of *Trypanosoma equiperdum*, by J. R. Mohler; Twenty-seven Years' Experience in Veterinary Practice, by J. V. Newton; Accidents and Sequelæ of Surgical Operations, by L. A. Merillat; Indications for Neurectomies of the Pelvic Limb of the Horse, by R. C. Moore; The Profession and the Advancement of Science, by D. A. Hughes; Stable Ventilation, by M. H. Reynolds; The Status of Therapeutics, by P. A. Fish; A Review and Criticism of the Eighth Decennial Revision of the Pharmacopœia of the United States, by E. L. Quitman; Hydrothorax in the Horse, by G. B. Jones; and A New Treatment for Gastro-Intestinal Catarrh of Milk-Fed Calves, by L. A. Klein.

Annual report of the State board of live stock commissioners of Ohio, P. Fischer (*Ann. Rpt. Bd. Live Stock Comrs. Ohio, 4 (1905), pp. 71, figs. 14*).—The diseases which have occurred in Ohio to an extent which attracted the attention of the live stock board during the past 4 years included the most important diseases of horses, cattle, sheep, hogs, cats, and fowls.

The work of the board of the live stock commissioners has extended in many directions, until at present it is considered that the services of additional veterinarians are needed. As usual in these reports maps are given showing the location of anthrax, actinomycosis, foot-rot, glanders, hog cholera, swine plague, keratitis, nodular disease, rabies, mange in horses, tuberculosis, and Texas fever. In the case of each one of these diseases a brief account is presented of the work of the State veterinarian and his assistants in controlling the outbreaks.

In an appendix to the report copies are given of laws relating to live stock and the duties of the board of live stock commissioners of Ohio.

Abstracts of work done in the laboratory of veterinary physiology and pharmacology, III, P. A. Fish et al. (*Ithaca: N. Y. State Vet. Col., 1906, pp. 44*).—An account is presented of a case of urethral calculus in the dog (pp. 3–8), arecolin hydrobromate and its action upon dogs and cats (pp. 9–13), the effects of sulphurous acid upon peptic and tryptic digestion (pp. 14–21), ergot as an abortifacient (pp. 22–29), the status of therapeutics (pp. 30–34), the structure and function of the digestive tract of the chicken (pp. 35–42), and the effect of sulphurous acid upon the urinary constituents (pp. 43, 44).

In experiments with ergot in which cats were used, it was found that doses of this drug would produce abortion within 24 hours. In some cases the young were killed, while in others they seemed not to be affected. It is concluded, therefore, that ergot exercises an abortifacient action of considerable power. Attention is called to the present status of therapeutics as a profitable subject of study for veterinarians. New drugs are constantly being put on the market, and from the great number thus offered for use the veterinarian must select, as a result of experiment, those which really give promise of good results. Some of the new remedies are superior to the old ones used for specific purposes, while others are no better or quite inferior.

The Bang method of controlling tuberculosis with an illustration of its application, H. A. Harding, G. A. Smith, and V. A. Moore (*New York State Sta. Bul. 277, pp. 81–109*).—A general account is presented of the nature of tuberculosis, together with a description of the Bang method of controlling the disease and the use of tuberculin.

In December, 1900, one animal in the station herd was found to be tuberculous and on this account the tuberculin test was given to the whole herd. As a result of the test a reaction was obtained with 8 cows and 7 young cattle in a total of 28. These animals were kept under observation, and in 1901 the Bang system was put in operation for the purpose of determining its value under the conditions which prevailed in the station herd.

The method was applied to a total of 30 animals, 13 of which were healthy and 17 tuberculous. During the 4 years of the test this herd produced 23 heifer calves,

one-half of them coming from the tuberculous animals. The calves obtained from the tuberculous cows were not allowed to suck their mothers nor to drink tuberculous milk until after it had been pasteurized at a temperature of 185° F. The record of the tuberculous part of the herd is given in a tabular form and notes are also presented on autopsies on diseased animals and an examination of the meat of tuberculous animals killed for beef.

A healthy herd from a tuberculous herd, F. H. Hall, H. A. Harding, G. A. Smith, and V. A. Moore (*New York State Sta. Bul. 277, popular ed., pp. 8, fig. 1*).—A popular summary of Bulletin 277, noted on page 1189.

Combating tuberculosis in farm animals, A. Van Leeuwen (*Tijdschr. Veeartsenijk., 33 (1906), No. 6, pp. 340–345*).—This is a controversial article in which the author takes the position that a governmental requirement of notification of all cases of tuberculosis in domesticated animals would work great hardship. It is frequently impossible for the owner to determine when an animal is affected with the disease, in fact the most experienced veterinarians sometimes have to make use of all means of diagnosis in order to determine the matter.

Distribution of tuberculosis in suspected and nonsuspected herds in Wisconsin, H. L. Russell and E. G. Hastings (*Wisconsin Sta. Bul. 133, pp. 15, figs. 3*).—On account of the insidious nature of tuberculosis and also on account of the fact that the disease has been found very prevalent in certain dairy herds the present bulletin has been prepared for the purpose of furnishing a concise description of the tuberculin test and further data regarding the results obtained from this test and its reliability.

Brief summaries are presented of some of the previous work done by this station on tuberculosis, and recommendations are made regarding the disinfection of stables. For this purpose the authors recommend a whitewash made of fresh unslaked lime, and also saturated solution of copperas.

Are tubercle bacilli coughed up by cattle affected with pulmonary tuberculosis? J. A. Klauners (*Tijdschr. Veeartsenijk., 33 (1906), No. 6, pp. 351–353*).—From statistics regarding the organs affected in cases of bovine tuberculosis it appears that the lungs were diseased in 40,306 cases among a total of 46,092. On the basis of these facts and the further fact of the frequent infection of the lymphatic glands of the throat and pharynx, the author justifies the conclusion that tuberculosis in cattle is very frequently contracted by inhalation and that, therefore, the tubercle bacilli which cause such infection probably come from other cows affected with the pulmonary form of the disease.

Serum vaccination against anthrax, G. Gazzaniga (*Clin. Vet. [Milan], 29 (1906), No. 8, pp. 203–205*).—Brief notes are given on vaccination for the purpose of preventing anthrax by the method which requires the use of two vaccines. This method has given satisfactory results in the author's hands.

Blackleg, W. H. Dalrymple (*Louisiana Stas. Bul. 85, pp. 7, fig. 1*).—Inquiries are frequently received at the station regarding the nature of blackleg and suitable treatment for this disease. It is suggested that probably many young scrub cattle of little value die of blackleg from year to year without any investigation of the cause of the disease. This fact may account for the persistence of the disease in certain localities. Notes are given on the cause, symptoms, treatment, and preventive vaccination for blackleg.

Vaccination against blackleg, K. R. Kuipers (*Tijdschr. Veeartsenijk., 33 (1906), No. 6, pp. 345–351*).—Various methods were tried in vaccinating calves against blackleg. The author used vaccine thread, dried vaccine, and material in solution. The best results were obtained from the last-named method. Brief notes are given on the pathological anatomy of blackleg based on a number of autopsies.

Texas fever with methods for its prevention, J. R. Mohler (*U. S. Dept. Agr., Bur. Anim. Indus. Bul. 78, pp. 48, pl. 1, figs. 3*).—The author presents a valuable

summary of information relating to the nature of Texas fever and the practical means of its eradication.

The subject-matter includes a definition of the disease; notes on its history and distribution; etiology; life history of the cattle tick and its agency in distributing Texas fever; means of distinguishing between this tick and other species of ticks; the loss caused by ticks aside from their agency in carrying Texas fever; symptoms, course, and termination of Texas fever; and treatment and prevention of the disease. Definite and practicable plans are presented for the arrangement of farms so that cattle may be freed from ticks and the ticks ultimately eradicated by the system of feed lots and pasture rotation. The method of immunization by means of the blood of recovered cattle is also described.

Vaccination against foot-and-mouth disease, N. L. Buonsanti (*Clin. Vet. [Milan], 29 (1906), No. 6, pp. 145–148*).—Numerous experiments have been carried out in vaccinating cattle against foot-and-mouth disease by means of a mixture of 0.03 cc. of virulent lymph and 0.5 cc. of bovine serum. For vaccinating hogs and sheep the author has used a concentrated serum from a horse previously inoculated with the virus. The results thus far obtained are promising.

The treatment of epizootic abortion, E. Thierry (*Jour. Agr. Prat., n. ser., 11 (1906), No. 7, pp. 208, 209*).—A number of investigators have found that good results may be obtained from the use of antiseptic solutions, such as the use of corrosive sublimate, 1:1,000 parts in water, and a solution of iodin and iodid of potash. An internal prophylactic treatment, with doses of 5 to 6 drams of iodid of potash, has also given satisfactory results.

The poisoning of cattle by tobacco decoction, F. Peuch (*Jour. Méd. Vét. et Zootech., 57 (1906), Feb., pp. 78, 79*).—Two heifers which had become greatly infested with fleas were treated by the owner with tobacco decoction as obtained from the manufacturer and diluted with an equal amount of water. Within a few hours serious symptoms of poisoning occurred, the animals being unable to rise and in a state of extreme coma. Considerable irritation of the skin was also produced. Recovery took place on the following day.

Attention is called by the author to the fact that tobacco decoction, diluted with 10 parts of water, is effective in such cases and ordinarily does not produce poisonous effects.

Vaccination for hog cholera, L. Brusasco (*Gior. R. Soc. ed Accad. Vet. Ital., 55 (1906), No. 6, pp. 123–125*).—References are made to some of the more important publications on this subject and a table is given showing the results of vaccination against hog cholera during 1905. From this table it appears that the percentage of mortality in nonvaccinated hogs was 79.6, while in vaccinated animals it was 17.4.

Combating swine plague, Foth (*Berlin. Tierärztl. Wchnschr., 1906, No. 7, pp. 115–123*).—From the standpoint of the veterinary police, swine plague includes hog cholera as well as swine plague proper.

Although these diseases frequently occur simultaneously in the same animal, the official veterinary police must depend largely upon the clinical symptoms and the infectiousness of the disease in reaching a diagnosis. The persistent spread of swine plague is attributed to its already wide distribution, the chronic course of many cases, the aversion to strict quarantine, traffic in live pigs, too early period of weaning pigs, neglect of hygienic precautions, and the extensive use of improved breeds, some of which are less resistant than grade hogs.

Antidotes for poisoning by Gastrolobium calycinum, E. A. Mann (*Jour. Dept. Agr. West. Aust., 13 (1906), No. 1, pp. 50, 51*).—Feeding experiments were carried out with this plant in the case of sheep in order to test various antidotes for the alkaloid poison in the plant. Permanganate of potash in acidulated water appeared to have no influence in checking the poisonous effects. Negative results were also

obtained with sodium bicarbonate. The action of tannic acid, however, when given as a drench in doses of ½ oz. appeared to be quite satisfactory.

Suggestions as to dipping sheep (*Jour. Bd. Agr. [London]*, 17 (1910), No. 11, pp. 678–681).—Directions are given for cleaning dipping tanks and catching pens, mixing dips, trimming the wool, and related matters, together with notes on the proper time of dipping and on the repetition of the process.

Infectious broncho-pneumonia of lambs, E. THIERRY (*Jour. Agr. Prat., n. ser., 14 (1910), No. 4, pp. 110–112*).—Opportunity was had for studying a rather serious outbreak of pleuro-pneumonia of lambs. As a result of this study it appears that the disease is of bacterial origin, although the micro-organism was not isolated. In controlling the disease the usual procedure in cases of infections is recommended, viz, isolation of diseased animals and thorough disinfection.

Further notes on the pathogenic organism of pneumonia and its biology, LORENZ (*Berlin. Tierärztl. Wchnschr., 1909, No. 9, pp. 145–147, figs. 3*).—As reported in previous articles by the author, an organism was found in the skin of horses affected with pneumonia several days after recovery.

This organism was obtained under the observation of the strictest rules of asepsis and proved to be a streptococcus when cultivated on artificial nutrient media. The streptococcus appears to develop from minute rods. This organism when used in inoculation reproduces the disease. The author believes as a result of a further study of this organism that it is really a plasmodium or sporozoan, which may be observed in various forms, such as spores and rods, which may unite to form streptococcus.

The demonstration of the organism of pneumonia in horses and its biology, LORENZ (*Berlin. Tierärztl. Wchnschr., 1909, No. 7, pp. 113–115, figs. 8*).—On account of the irregular manner in which an outbreak of pneumonia usually progresses in a herd of horses it has been assumed by many investigators that the organism of this disease must require an intermediate host, and in this connection flies have been suggested.

The author finds, however, that the organism persists for a long time in the subcutaneous tissue. It has been found in considerable numbers in such locations and kept in pure cultures. When the virus thus obtained was inoculated into rabbits, cocci were found in the blood 20 hours after inoculation. Since the organism described by the author appears to be the true cause of pneumonia, it is believed that a method of vaccination can now be readily devised which will protect animals against the disease.

Pleuro-pneumonia, MOUQUET (*Bul. Soc. Cent. Méd. Vét., 83 (1909), No. 4, pp. 114–117*).—Notes are given on the symptoms of pleuro-pneumonia in horses in which septic edema occurred and an ammoniacal fermentation in the thoracic cavity. A study was made of the reaction and chemical properties of the serous fluid in the pleural cavity and the gases developed by the ammoniacal fermentation in this fluid were studied.

Experiments with contagious coryza, with especial reference to the immunization of rabbits against this disease, J. LUDWIG (*Monatsh. Prakt. Tierheilk., 21 (1910), No. 7–8, pp. 289–321*).—The literature on this disease is critically reviewed in connection with a short bibliography.

It appears from experimental work carried out by the author that rabbits may be actively immunized against contagious coryza. A number of methods are successful in accomplishing this result, but the best seems to be found in the use of cultures killed by means of heat or by the use of iodin trichlorid. The active immunization may be brought about rapidly and may be carried to a high degree by repeated inoculations. The organism of contagious coryza is practically nonvirulent for rabbits when inoculated hypodermically, but in intraperitoneal injections it rapidly produces death. From the blood of rabbits thus immunized a serum may be obtained which will protect other animals from infection.

Experiments in protective inoculation against contagious coryza with dead streptococci, T. KITT (*Monatsh. Prakt. Tierheilk., 17 (1906), No. 7–8, pp. 363–367*).—The experiments reported in this paper were carried out on colts. It was found possible to immunize colts to a considerable extent by inoculating them with dead cultures of the streptococcus of contagious coryza. The method, however, has little to recommend it in actual practice, since in order to obtain a protective immunity 6 or 7 treatments must be given. Passive immunity which may be produced by means of injections of serum has only a short duration.

Kimberley disease in horses, R. E. WEIR ET AL. (*Jour. Dept. Agr. West. Aust., 12 (1905), No. 1, pp. 60–63*).—This disease has a course of variable duration and is characterized by symptoms of congestion and derangement of the brain.

It appears that the extraordinary mortality which occurs from attacks of this disease can not be attributed solely to one cause. The presence of parasites, however, particularly *Spiroptera megastoma*, may be looked upon as a predisposing cause, in connection with coarse forage and the ingestion of large quantities of green food. In treating the disease the author recommends antipyrin 3 times daily in doses of 1 dram together with a mixture containing ½ dram calomel and ½ oz. ginger.

A skin disease in horses affecting only the white markings, E. E. MARTIN (*Vet. Rec., 18 (1906), No. 922, pp. 628, 629*).—In Calcutta the author observed a number of cases of skin disease in Australian horses which had just been landed. The white parts only were affected and appeared as if blistered. The disease was attributed to an attack of insects, but the exact species was not known.

Osteomalacia in Tonquin, J. SOURREL (*Rec. Gén. Méd. Vét., 7 (1906), No. 77, pp. 233–248, figs. 3*).—During the years 1901–1904 the author had occasion to study osteomalacia in horses and mules in Tonquin.

It was found that the disease appears after a varying period following upon exposure or introduction to an affected region. The usual period ranges from 6 months to 2 years. Animals first appear lame and depressed, later malformations may appear particularly in the form of enlargements of the flat bones and short articular bones. Fractures of the long bones in the leg may occur at any time during the course of the disease. Ultimately the stage of extreme cachexia results, so that prognosis is always serious.

It was found that osteomalacia occurs in regions where there is plenty of lime in the soil and in the forage plants as shown by analysis. The absence of lime could, therefore, not have been the cause in the cases observed by the author. It is believed that the disease is of infectious origin, but the organism has not been isolated. Therapeutic treatment is not very successful, but some benefit was derived from the use of pilocarpin, purgatives, strychnin, and feeding green forage plants, for which purpose the author recommends the use of *Panicum æquinum*.

Use of artificial impregnator in horse breeding, L. L. LEWIS and W. L. ENGLISH (*Oklahoma Sta. Circ. 5, pp. 8, figs. 6*).—The importance and general use of the artificial impregnator by stockmen led the station to send out a circular letter of inquiry regarding the methods in common practice.

It appears that there are two forms of impregnator in general use, the straight and the curved. The latter is preferred, and may be used with or without a vaginal speculum. If a breeding bag is used on the stallion a speculum will be found unnecessary. Before service it may be well to close the neck of the uterus with a rubber plug. After service the plug is removed at once, a part of the semen injected into the uterus and the rest used to impregnate other mares. Before transferring the semen the syringe should be warmed in water at a temperature of 100° F. and the transfer should take place without delay.

Experiments in preserving semen in vials for a period of 3 hours or more showed that a temperature of 100–103° F. is less favorable to the vitality of the spermatozoa than 85° F. In Oklahoma the breeding bag is used by about two-thirds of those who

impregnate mares artificially. As was to be expected, better success attends the efforts of the breeder the longer he practices the method.

The effect of experimental epilepsy on poisoning by tetanus toxin, L. Cesari (*Compt. Rend. Soc. Biol.* [*Paris*], *60* (*1906*), *No. 8, pp. 397–399*).—It has been claimed by a few investigators that the effects of tetanus toxin may be somewhat overcome by passing an alternating electro-current through affected animals.

This was tested on guinea pigs by the author with the result that little benefit was found from the practice. Guinea pigs inoculated with tetanus toxin showed the epileptiform crisis of the disease during the passage of an alternating current in the same manner as shown by normal animals. The muscular contractions disappeared for a few minutes after the epileptiform crisis but soon recurred again. Animals treated in this manner lived little longer than the control animals.

Treatment of demodectic mange, Cedéac (*Jour. Méd. Vt. et Zootech., 57* (*1906*), *Feb., pp. 80–83*).—Attention is called to the undesirability of attempting to treat all forms of mange and parasitic skin diseases by similar lines of treatment. In some forms of mange caused by demodectes as well as phlegmenous dermatitis it is usually best to scarify the affected parts and apply tincture of iodin.

The bacillus of mouse typhoid and related forms, R. Trommsdorf (*Arch. Hyg., 55* (*1906*), *No. 3, pp. 279–298*).—An attempt was made to determine the relationship and independence or identity of various bacteria related to the mouse typhoid bacillus.

In experiments along this line a series of agglutination tests were made, but it was found that agglutination is a very uncertain method of determining the identity or specific individuality of bacteria of this group. Apparently *Bacillus enteritidis* is distinct from the other bacteria of this group, while there are various groups under the paratyphoid bacillus as well as of the hog cholera bacillus. It was impossible by means of agglutination tests to differentiate between the mouse typhoid bacillus, hog cholera, paratyphoid, and meat-poisoning bacillus.

Attention is called to the fact that the bacilli which have been used for the destruction of mice as well as the hog cholera bacillus may be pathogenic for man. The author believes, however, that there is no justification for prohibiting the use of cultures of mouse typhoid bacillus in the destruction of field mice.

RURAL ENGINEERING.

Irrigation from Snake River, Idaho, H. G. Raschbacher (*U. S. Dept. Agr., Office Expt. Stas. Circ. 65, pp. 16*).—The territory covered by this circular extends from the Wyoming line to Salmon River, a distance of about 200 miles. In this area there is about 800,000 acres at present under ditch, and the proposed works will cover about 200,000 acres additional. Probably not more than half of this land is at present under cultivation, leaving a large area which is awaiting settlement.

This circular is devoted to the conditions which a new settler will meet in making a home in this section. With few unimportant exceptions, the settlers must secure rights from companies building ditches, there being little if any opportunity for securing rights directly from the streams. Most of the canals are built either under the Carey Act, under which the lands and water rights are disposed of on terms specified in contracts with the State, or under the reclamation act, which provides for the payment by the settler of the actual cost of the construction of the works, the lands being taken up under the homestead law, which requires the payment of land office fees only.

The prices of water rights under these various projects vary from $15 to $25 per acre. The expense which must be met by the new settler during the first year is estimated as follows, the full price of the water right being included in this estimate.

This, however, need not be paid during the first year, but may be distributed over a series of years.

First cost of the land and water right	$25.50
Fencing material	3.00
Labor:	
Grubbing sagebrush	3.50
Plowing	2.50
Seeding	.50
Leveling and marking	1.00
Ditching	2.00
Irrigating	2.00
Total cost per acre	40.00

The circular contains also the record of a number of crop experiments made at Twin Falls during the season of 1905.

Results of experiments on irrigated meadows, Tacke (*Mitt. Deut. Landw. Gesell., 21 (1906), No. 9, pp. 96–101*).—The experiments described were started in 1900 on meadow lands belonging to the agricultural improvement association of Bruchhausen-Syke-Thedinghausen.

Three types of soil were selected, a clayey loam meadow with a layer 25 to 30 cm. deep, rich in humus, a low moor, and a light sandy heath. These tracts were subdivided and given varying quantities of Thomas phosphate meal and kainit, with and without irrigation. The plats were irrigated by running and still water so as to compare the methods.

The average yield per acre without fertilizers on the first tract was increased 77 per cent by irrigating with running water, and 50 per cent by flooding in checks. With the application of a small amount of Thomas phosphate (150 kg. per hectare annually) there was a further increase of about 33 per cent, while additional quantities showed very small increases in the crop. Kainit alone showed no increase at all when applied at the rate of about 500 kg. per hectare annually, as the lands were not deficient in potassium salts. The other tracts show quite similar results.

In all cases the method of irrigating with moving water appears to give larger yields than the check-flooding method, averaging on the first tract 28 per cent greater, on the second 34 per cent, while on the third the advantage is even more marked. The running water is applied by ridging the land, and apparently not by furrows as in the United States. The author urges independent local experiments and cautions against accepting the data given as applicable under different conditions of soil and ground water.

Irrigated lands in Idaho (*The State of Idaho. Boise, 1905, pp. 59–62*).—A summary of irrigation statistics is presented, showing 3,600 miles of canals costing nearly $10,000,000 and covering over 2,000,000 acres, of which 840,000 are now under cultivation. The publication contains also articles on projects under the Carey Act and the Reclamation Act, and brief descriptions of irrigation systems by counties. The report is profusely illustrated.

[**Irrigation in Wyoming**] (*The State of Wyoming. 1905, pp. 54–79, pls. 6*).—Under the titles Public Lands and Irrigation Projects, State Lands, and How to Obtain a Right to Use Water in Wyoming, a review is given of Reclamation and Carey Act projects, ditches built and projected by private parties, and the laws relating to public lands and water rights.

Method and cost of constructing cement pipe in place, H. P. Gillette (*Engin. Rec., 53 (1906), No. 10, pp. 349, 350, figs. 2*).—The Ransome method of making continuous cement sewer pipe in place, which is described here, suggests the use of the same machine for drain pipes.

The device consists of a core 10 ft. long, with a sectional sheet-iron mold. The cement is rammed into place by hand, and the whole machine is moved gradually forward by winding up a cable by a lever and ratchet windlass. The actual cost of laying 8-in. pipe at Rochester, N. Y., was 6.6 cts. per foot, and for 12-in. pipe 10.25 cts. per foot, 300 to 400 ft. a day being laid with a crew of 7 or 8 men. While the pipes laid are said to be as tight as cement-jointed vitrified pipe, it would not be difficult to make them porous enough for drainage by using less cement or by providing openings.

An investigation of the ancient hydraulic works in Algeria, S. Gsell (*Paris: Govt., 1902, pp. 143, figs. 27*).—This report consists of descriptions of hydraulic works of Roman origin found in the various provinces of Algeria, written by local administrative officers, engineers, or army officers familiar with particular localities. There are described about 80 barrages, 30 reservoirs, 20 aqueducts, and a large number of smaller hydraulic works formerly used for irrigation or city water supplies.

Strainers for driven wells, D. H. Maury (*Engin. News, 55 (1906), No. 10, pp. 260, 261, figs. 3*).—While fine strainers have been generally favored because they exclude fine sand, their capacity and durability are low.

The principle of the coarse strainer is that fine sand is freely admitted and may be pumped out, thus washing all the fine material from a zone surrounding the strainer and creating what is virtually a strainer of clean gravel having a large capacity, and since a certain initial velocity is required to start fine material toward the well, no silt will be drawn in when pumping any less water than the maximum capacity of the sand pump.

The author describes several well-strainers and the methods of perforating well casings after driving.

Mountain road construction in Idaho, E. B. Darlington (*Engin. News, 55 (1906), No. 11, pp. 282, 283*).—The legislature of Idaho in 1905 authorized the expenditure of $50,000 for mountain roads, under the supervision of a State commission, the cost of new roads to be divided with the community benefited.

Over 100 miles of road have already been built or are nearing completion under this law. It is the policy of the commission to spend only $500 to $1,000 per mile, the roads being 8 to 12 feet wide, with a maximum grade of 12 per cent. Turnouts are built every half mile. All running streams are bridged, culverts are built in dry channels, and swampy places are corduroyed, all such structures to be 12 ft. wide. The roads are carefully located with a view to future improvements.

Road maintenance, R. A. Meeker (*Engin. Rec., 53 (1906), No. 13, pp. 424, 425*).—An article written for the annual report of the New Jersey commissioner of public roads. The problem of maintenance is to reduce wear and replace worn material cheaply. Good drainage is essential; the wearing surface should be hard, and should be kept free from dust by sweeping or scraping, if the rains do not keep it washed away. General repairs should be made in fall and spring, and prompt minor repairs at all seasons. The use of the best stone only is recommended.

RURAL ECONOMICS.

Depreciation in agricultural values, P. Caziot (*Jour. Agr. Prat., n. ser., 11 (1906), No. 7, pp. 203–206*).—The value of agricultural land in France advanced during most of the nineteenth century, but since 1880 there has been a very great decrease, the decrease being as great as 70 or 80 per cent in some instances.

In general the land of the peasant proprietors has decreased to a greater extent than that of large estates. The causes given for this depreciation are that capital invested in land yields smaller returns than formerly, due to changes in agriculture which make the land a relatively less important agent in agricultural production. Intensive cultivation has given to operating capital a greater importance than it for-

merly had in agricultural operations. A second cause assigned is the decrease in rural population, which has resulted in a rise in wages.

Report on the operation of agricultural insurance societies, A. DE CÉRIS (*Jour. Agr. Prat., n. ser., 11 (1906), No. 14, pp. 421, 422*).—The official journal of April 1 contains a report on the operation of mutual agricultural insurance societies.

There has been in the last 9 years a very great increase in the number of these societies. There were 1,484 such societies in 1897, and 6,556 in 1906. They insure live stock against death, agricultural buildings against fire, crops against hail, and farmers against accident. The total amount of risks carried is 3,920,100 francs (about $785,000). The government supervises the organization of the new societies, paying special attention that the rates are high enough to insure payment of indemnities. It also supervises in a limited way the operation of societies and aids them in case of special need resulting from epidemics.

The government has encouraged so far as possible the federation of the smaller societies in order that they may have greater stability.

The loans of the Credit Foncier for agricultural enterprises, A. DE CÉRIS (*Jour. Agr. Prat., n. ser., 11 (1906), No. 14, p. 422*).—The commission appointed by the ministry of agriculture to make a study of the Credit Foncier and recommend modifications to make its loans more popular, has recommended that loans for drainage and other agricultural improvement shall be made easier, that loans should be extended to agricultural societies organized under the laws of 1865–1888, that interest should be lowered, and that the system of guaranteeing reimbursement be revised.

Meat in foreign markets, tariffs of fourteen importing nations, and countries of surplus (*U. S. Dept. Agr., Bur. Statis. Bul. 39, pp. 95*).—This bulletin contains a summary of information concerning the export trade in American meat, animal and packing-house products, the customs tariffs of 14 of the principal countries importing these animals and products, and the conditions of production of these commodities for export in 12 countries which are, or may become, competitors of the United States in this industry.

Meat animals and packing-house products imported into eleven principal countries, 1895–1904 (*U. S. Dept. Agr., Bur. Statis. Bul. 40, pp. 92*).—The value of the meat animals and packing-house products imported into 13 European countries and Cuba in 1904 was $506,715,512. Of the total amount sent to 11 of the countries included, the United States supplied 40.38 per cent.

Norway, Sweden, and Russia as markets for packing-house products (*U. S. Dept. Agr., Bur. Statis. Bul. 41, pp. 21*).—Information obtained from published official reports is summarized and classified.

The value of meat and other packing-house products imported into Norway in 1902–1904 had a value of $4,585,000, an increase of 29 per cent over 1895–1897. In Sweden the total value of these products imported was $4,227,000 in 1901–1903, and in Russia $4,337,000. In Sweden the increase since 1895–1897 was 62.3 per cent. "Russia being primarily an agricultural country with an enormous export of grain, and the Russian people consuming very small quantities of meats, the imports of meat animals and packing-house products are very small and do not show any strong tendency to increase."

Cotton production and statistics of cotton-seed products, 1905 (*Bur. of the Census [U. S.] Bul. 40, pp. 72, maps 2*).—This bulletin gives cotton statistics of the United States for the years 1902, 1903, 1904, and 1905; sketches the history of the production of cotton throughout the world; discusses the possible increase of cotton growing in the United States and other countries; and describes the products made from cotton seed, giving statistics.

The total production of cotton in the United States in 500-lb. bales was 10,827,168 in 1902, 10,045,615 in 1903, 13,679,954 in 1904, and 10,804,556 in 1905. The estimated value of the cotton crop was $501,897,134.65 in 1902, $660,549,230.82 in 1903,

$652,031,635.97 in 1904, and $632,298,322.57 in 1905. The conclusion reached regarding the production of cotton in foreign countries is that only in the remote future is there a prospect of any other country than the United States producing any large amount of cotton for export.

There has been a very large increase in the establishments making cotton-seed products since 1900, the number in that year being 369, and 715 in 1905. The value of the products increased from $19,335,947 in 1890 to $96,407,621 in 1905. These products include linters, hulls, and oil.

An introduction to the history of sugar as a commodity, Ellen D. Ellis (*Bryn Mawr Col. Monographs, 4 (1905), pp. 117*).—This monograph presents a study of the statics and dynamics of sugar and of the history of the substance as a commodity in various countries of the world. A list of over 100 references bearing on the subject from a practical, historical, geographical, and technical standpoint is given.

AGRICULTURAL EDUCATION.

Higher agricultural education, E. A. Bryan (*Pullman, Wash.: Author, 1905, pp. 16*).—An address delivered before the Educational Congress of the Lewis and Clarke Exposition at Portland, Oreg., in which the aims of pure and applied science are set forth, and the development of agricultural education in the United States is outlined. Agricultural education is characterized as genuine, real education which can not do without the old instruments of education, but which "has added new and better instruments for the purpose of mind growth along certain directions, namely, that of the life which the student is to lead."

Educational agriculture, W. R. Hart (*Peru, Nebr.: Author [1906], pp. 16*).—This is a discussion of the pedagogics of agriculture based on the premise that "before agriculture becomes entitled to a permanent place in the common school course it must withstand three tests: First, the test of usefulness; second, the test of mental discipline; third, the test of humanizing culture." The conclusion of the author is "that from whatever point of view the subject is approached, agriculture gives an affirmative answer to every test that can be applied to any subject, not excepting the richest, in any course of study."

How can a college of agriculture keep close to the ground? L. H. Bailey (*Cornell Countryman, 3 (1906), No. 9, pp. 207, 208*).—The writer discusses means of bringing the people and the college closer together, and among other things suggests the sending of college students to approved farms to learn advanced farm practice, and the bringing of experienced farmers to the college to lecture and consult informally with students.

Proceedings of the nineteenth annual convention of the Association of American Agricultural Colleges and Experiment Stations held at Washington, D. C., November 14–16, 1905, edited by A. C. True, W. H. Beal, and H. C. White (*U. S. Dept. Agr., Office Expt. Stas. Bul. 164, pp. 189, dgms. 2*).—An account of this convention has been given (E. S. R., 17, p. 321).

Proceedings of the tenth annual meeting of the American Association of Farmers' Institute Workers, edited by W. H. Beal, J. Hamilton, and G. C. Creelman (*U. S. Dept. Agr., Office Expt. Stas. Bul. 165, pp. 95*).—This is a detailed account of the proceedings of the meeting held at Washington, D. C., November 9–11, 1905.

Animal husbandry—four-year course, R. S. Shaw (*Rpt. Mich. Acad. Sci., 7 (1905), pp. 142–144*).—This is a syllabus of a course in animal husbandry for graduates of a good high school, followed by a discussion of some features of the syllabus. Out of a total of 382 hours in the course 129½ hours are devoted to animal husbandry subjects, 30 hours to other agricultural subjects, and 25½ hours to hygiene, anatomy,

and veterinary science. The remainder of the time is taken up with English, mathematics, chemistry, botany, bacteriology, and drawing.

Course in cheese making for movable schools of agriculture, L. L. Van Slyke (*U. S. Dept. Agr., Office Expt. Stas. Bul. 166, pp. 63*).—This is the first of a series of courses designed to give more extended and specific instruction in agriculture outside of regularly organized schools than is now being given in the farmers' institutes. A brief statement concerning the plan for the movable schools is given in a prefatory note by the farmers' institute specialist of this Office. The course outlined in this bulletin consists of 14 lectures accompanied by 14 practicums. The bulletin also contains a list of apparatus needed in giving the course in cheese making and lists of references to the literature of the subject.

Syllabus for a four-year course in horticulture, U. P. Hedrick (*Rpt. Mich. Acad. Sci., 7 (1905), p. 141*).—This is a syllabus of a course in horticulture suitable for graduates of a good high school. Required horticultural subjects occupy 65 out of a total of 420 hours, and this number may be increased to 110 hours by choosing senior electives in horticulture.

Teaching horticulture in high schools (*Agriculture* [*Nebr.*], *5 (1906), No. 2, pp. 2–6*).—Reasons for teaching horticulture and topics best suited for horticulture in high schools are given, also some items of necessary equipment, the most important of which is the school garden.

Topics in horticulture for common schools, U. P. Hedrick (*Rpt. Mich. Acad. Sci., 7 (1905), p. 140*).—Horticultural topics suitable for common schools are arranged under the three heads propagation of plants, vegetable gardening, and pomology.

Outline for a brief course in agricultural economics, K. L. Butterfield (*Rpt. Mich. Acad. Sci., 7 (1905), pp. 149, 150*).

Outline for a brief course in rural sociology, K. L. Butterfield (*Rpt. Mich. Acad. Sci., 7 (1905), pp. 150, 151*).

Courses in some phases of rural economy. Outline for a course in farm management, F. W. Card (*Rpt. Mich. Acad. Sci., 7 (1905), pp. 148, 149*).

Teaching agricultural economics in the agricultural high schools, E. Vliebergh (*Rev. Gén. Agron., 14 (1905), Nos. 10–11, pp. 444–452*).—The author states that agricultural economics might be held to include studies of agricultural practice and also studies of economic, social, political, and legal conditions, but confines his discussion to the latter. A complete course of instruction is outlined. It includes property rights in land; rents; statistics; land taxes; tariff; public regulations; size of land holdings; succession; subdivision of holdings; credit; capital; labor; insurance; agricultural associations; teaching of agriculture; sanitary regulations, etc. It is recommended that class work be supplemented by the preparation of monographs, students studying conditions in their home communities and by seminar work.

How to determine what to teach in nature study, L. A. Hatch (*Nature-Study Rev., 2 (1906), No. 1, pp. 13–17*).—An argument in favor of teaching nature study with a clearly defined object in view. The writer holds that in planning a course in nature study "(1) A vital human relation should be found in all the work undertaken; (2) the course should contain within itself a rich content that is worth studying; (3) there should exist an intimate relation among the parts, holding the same together in such a manner that the work covered from year to year will be progressive and united."

Nature study in its practical bearings, J. P. Stewart (*Nature-Study Rev., 2 (1906), No. 2, pp. 55–66; reprinted from* [*Ill.*] *Normal School Quart.*).—A discussion of the reason for teaching nature study, its relation to agricultural teaching, what it should include, the principles that should guide in its organization and presentation, and the place where it should be taught. The writer's answer to the last question is "The all-important place for nature study is in the country school." The two prob-

lems for discussion in reaching the country school are (1) how to reach the teacher and (2) what to do in these schools, and how.

The relation of nature study to manual training, W. A. BALDWIN (*Nature-Study Rev., 2 (1906), No. 2, pp. 41–48, figs. 2*).—The writer discusses the relationships between these two subjects from 2 standpoints, that of the subject taught and that of the child. In the first case he shows that while nature study and manual training were once wide apart, they have been modified until they come very near together. Secondly, from the standpoint of the child, "the only true line of approach," he finds that it is difficult to distinguish between the two—that with the child at home on the farm most of nature study is also manual training, and vice versa.

Experiences in school gardening, J. B. DANDENO (*Rpt. Mich. Acad. Sci., 7 (1905), pp. 156–160*).—An argument against the feasibility and desirability of conducting school gardens in rural schools based on the experience of the writer in growing plants and trees in a country school, and against teaching elementary agriculture in such schools based on the premise that "agriculture is purely and necessarily an art," and that in order to teach it the sciences botany, zoology, chemistry, physics, mineralogy, and geology would have to be taught.

The school garden at Bowesville, Canada, E. A. HOWES (*Nature-Study Rev., 2 (1906), No. 2, pp. 48–55, figs. 2, dgm. 1*).—An interesting account is given of a successful experiment "to determine what might be accomplished along the line of nature study by means of a school garden in a large ungraded rural school, under stable conditions, by a trained teacher supposed to be interested in the work." While the work in the lower grades did not differ materially from other school garden work, that in the upper grade consisted largely of cultural and spraying experiments with potatoes, this crop being one of the leading staples of the region.

The preparation of teachers for the rural common schools, E. BURNHAM (*Rpt. Mich. Acad. Sci., 7 (1905), pp. 152–155*).—After discussing some of the essentials of training for rural school teachers, the author considers the county normal training classes now in vogue in Michigan and the courses for rural teachers in the State normal schools.

The school garden and the country school, G. D. FULLER (*Ottawa Nat., 19 (1906), No. 12, p. 235–246, dgm. 1*).—An account of school garden work in connection with a Macdonald rural school at Brome, Quebec, giving particulars regarding the conduct of the garden work during the winter and spring terms, and in the summer vacation.

True nature study: Its fundamentals and its relation to some other subjects, J. V. CRONE (*Nature-Study Rev., 2 (1906), No. 5, pp. 177–184*).

Nature study and gardening, ESTELLE REEL (*Washington: Govt. Printing Office, 1905, pp. 27, figs. 4*).—A bulletin giving suggestions to teachers in Indian schools regarding nature study lessons, window boxes, and gardening.

Education in Indian rural schools. A plea for nature study, F. G. SLY (*Agr. Jour. India, 1 (1906), No. 2, pp. 115–122*).—An argument for rural school instruction dealing with concrete objects before abstract, proceeding from the known to the unknown, and basing instruction upon the familiar surroundings of the child.

"The familiar surroundings of the rural school boy are essentially agricultural, so that his education should very largely be based upon agriculture." A distinction is made between teaching agriculture, which is not recommended, and teaching nature study through the use of agricultural material, which is strongly urged. Suggestions are given for training teachers in cooperation between the education and agricultural departments of India.

Royal Hungarian Central Viticultural Institute (*L'Institut Central Ampélologique Royal Hongrois. Budapest, 1905, pp. 15, figs. 6, dgms. 2*).—This is a description of the organization, buildings, and other equipment of the Royal Hungarian Central Viticultural Institute opened at Budapest in 1904. The institute includes divisions of

biology, chemistry, zymology, and viticulture and enology, each under a chief subordinate to the director of the institute. The buildings include a main building containing offices, library, museum, auditorium, lecture rooms, and laboratories, and 4 separate laboratory buildings, one for each division. In the vicinity of the buildings are several vineyards containing American and European vines and hybrids.

Agricultural education in India, J. HARWARD (*Trop. Agr. and Mag. Ceylon Agr. Soc., 25 (1905), No. 5, pp. 717–722*).—An historical and general account of agricultural education in India, including the work done in agricultural colleges, secondary schools, and rural schools.

Schools for colonial agriculture, REINECKE (*Tropenpflanzer, 10 (1906), No. 4, pp. 238–243*).—An account is given of the schools for colonial agriculture existing in the different countries of Europe and European colonies.

MISCELLANEOUS.

Fourteenth Annual Report of Colorado Station, 1901 (*Colorado Sta. Rpt. 1901, pp. 53*).—This report, recently issued, contains a financial statement for the fiscal year ended June 30, 1901; and reports of the director, heads of departments, and field agents of the station, parts of which are abstracted elsewhere in this issue. The report of the Plains Substation includes notes on weather conditions, various horticultural and field crops grown during the year, stock raising, irrigation, and other topics.

Report of Florida Station, 1903 (*Florida Sta. Rpt. 1903, pp. 19*).—This contains a report of the director, a financial statement for the fiscal years ended June 30, 1902–3, a list of the bulletins issued by the station, and brief reports of the heads of departments.

Report of Florida Station, 1904 (*Florida Sta. Rpt. 1904, pp. 22*).—This contains a report of the director, a financial statement for the fiscal year ended June 30, 1904, departmental reports, and a list of the publications of the station available for distribution.

Seventeenth Annual Report of Illinois Station, 1904 (*Illinois Sta. Rpt. 1904, pp. 13*).—This contains a brief statement concerning the principal lines of station work during 1904, a list of the bulletins published by the station, and a financial statement for the fiscal year ended June 30, 1904.

Twentieth Annual Report of Maine Station, 1904 (*Maine Sta. Rpt. 1904, pp. 226*).—This is made up entirely of reprints of Bulletins 100–111 of the station which were issued during the year.

Twenty-first Annual Report of Maine Station, 1905 (*Maine Sta. Rpt. 1905, pp. 268*).—This is made up entirely of reprints of Bulletins 112–124 which were issued during the year.

Fourteenth Annual Report of New Mexico Station, 1903 (*New Mexico Sta. Rpt. 1903, pp. 30*).—This contains a report of the director on the work of the station during the year with a list of press bulletins issued, periodicals received by the station, and a list of the available bulletins and reports to date. Departmental reports containing in some instances experimental work are included and a financial statement is given for the fiscal year ended June 30, 1903.

Twenty-third Annual Report of the New York State Station, 1904 (*New York State Sta. Rpt. 1904, pp. 457*).—This contains a financial statement for the year ended September 30, 1904, a list of periodicals received by the station, meteorological observations noted elsewhere, and reprints of Bulletins 245–260 of the station.

Ohio Agricultural Experiment Station (*Ohio Sta. Circ. 48, pp. 3*).—This calls attention to the nature and results of the work of the station as a justification for asking for an increase in the State appropriation.

Fifteenth Annual Report of Wyoming Station, 1905 (*Wyoming Sta. Rpt. 1905, pp. 77*).—This includes the organization list, a report of the director on the work and publications of the station during the year, a financial statement for the fiscal year ended June 30, 1905, and reports of the heads of departments, parts of which are noted elsewhere. The director's report contains also statements concerning recent State legislation of interest to the station.

A report on lamb feeding experiments has been noted from another publication (E. S. R., 17, p. 688). Analyses of forage plants are reprinted from Bulletin 65 of the station (E. S. R., 17, p. 240).

Report of the Secretary of Agriculture, 1905, JAMES WILSON (*U. S. Dept. Agr., Rpt. 81, pp. 100*).—This is a separate of the Secretary's report previously noted (E. S. R., 17, p. 923).

Publications of the Office of Experiment Stations issued during 1905 and station publications received by the Office of Experiment Stations during 1905 (*U. S. Dept. Agr., Office Expt. Stas. Circ. 66, pp. 14*).—Previous lists of this kind have been published in the bulletins and annual reports of this Office, and recently reprinted and distributed in the form of separates, which with the present circular furnishes a complete list of all the publications of this Office and the experiment stations since their organization up to the end of 1905.

Accessions to the Department Library, 1906 (*U. S. Dept. Agr., Library Bul. 59, pp. 77*).

NOTES.

Alabama College and Station.—W. T. Clarke, assistant superintendent of university extension and assistant in entomology of the California University and Station, has been appointed entomologist of the station. W. Gilder, a graduate of the veterinary college of Cornell University, has been appointed assistant in veterinary science, vice I. S. McAdory, resigned. D. T. Gray has been promoted to assistant professor of animal industry. E. R. Miller, formerly in charge of the department of pharmacy and recently connected with the Cuban experiment station, has been elected professor of pharmaceutical chemistry, vice W. H. Blome, resigned to engage in commercial pursuits.

Connecticut State Station.—The station entomologist is devoting his attention to the gypsy moth, which has made its appearance in the State. One square mile of territory near Stonington is said to have been invaded.

Georgia College.—The State legislature has appropriated $100,000 for the purpose of erecting and equipping buildings for the agricultural college. Through the efforts of the alumni of the institution, the university has recently acquired 500 acres of land adjoining the campus.

Illinois University and Station.—W. C. Coffey has been appointed instructor in sheep husbandry and D. O. Barto instructor in agriculture. Mr. Barto will make a study of those phases of agriculture suitable for use in secondary schools. The following additions have been made to the station staff: L. Hagenaur and A. F. Kidder, department of agronomy; H. O. Allison, department of animal husbandry; and J. M. Barnhart, department of dairy husbandry.

Kentucky Station.—George Roberts has been appointed assistant chemist.

Maryland Station.—C. W. Melick, assistant in dairy husbandry at the Kansas Agricultural College, has been appointed dairyman of the station to take effect September 1. H. Jennings, a graduate of Cornell University, in the class of 1906, has been appointed poultryman to take effect September 1. E. H. Brinkley, formerly of the station, has been appointed assistant in demonstration work to take effect October 1. The last two positions have been provided for by station appropriations.

Massachusetts Station.—L. S. Walker was appointed assistant chemist in the division of foods and feeding July 1, vice A. C. Whittier, resigned.

New Hampshire College.—Dr. T. J. Headlee has been appointed entomologist and F. W. Putnam assistant professor of drawing.

Cornell University.—Dr. T. L. Lyon, recently appointed professor of experimental agronomy in the college of agriculture, will devote his time to research, taking up his work about September 1. Dr. G. F. Warren, horticulturist of the New Jersey Station, has been appointed assistant professor of agronomy. E. O. Fippin, heretofore detailed by the Bureau of Soils of this Department, will remain with the university as assistant professor of agronomy with reference to soils. J. W. Gilmore, instructor in agronomy, has been made assistant professor of agronomy. The college of agriculture now has six professors in agronomy. C. F. Clark has been appointed assistant agronomist.

New York State Station.—Director W. H. Jordan has been granted a four months' leave of absence, the first half of which he will spend in the West. E. B. Hart, associate chemist, has resigned to accept the position of professor of agricultural chemistry in the University of Wisconsin, and chemist of the experiment station. Increased appropriations for the next fiscal year have permitted the following promotions and additions to the station staff: W. J. Schoene, assistant entomologist; James Wilson, of the Oklahoma Agricultural College, assistant bacteriologist; Richard Wellington, of the Massachusetts Agricultural College, assistant horticulturist; and G. T. French, of the Massachusetts Agricultural College, assistant botanist.

Ohio Station.—Edmund Secrest, a graduate of the Kansas Agricultural College and recently connected with the Forest Service of this Department, has been appointed assistant in forestry at the station.

Oklahoma Station.—W. L. English, a graduate of the Oklahoma Agricultural and Mechanical College, for some time assistant in animal husbandry in the college and station, and at present engaged in farming in Pottawatomie County, Okla., has been appointed director of the Oklahoma Agricultural Experiment Station, and will assume the duties of the position September 1, 1906.

Rhode Island College and Station.—Dr. Cooper Curtice has resigned to take up work in the Bureau of Animal Industry of this Department in connection with the eradication of the Texas fever tick. J. G. Halpin, instructor in poultry husbandry in the college, has resigned to accept a similar position in the Michigan Agricultural College. J. W. Bolte, a graduate of the Michigan Agricultural College and poultryman of the Utah College and Station, has been appointed assistant professor of animal industry and will have charge of poultry instruction. He will also be connected with the experiment station. Prof. F. C. Black, of the Indiana Normal University and College of Applied Science, has been appointed to the chair of highway engineering and will begin his new duties in September.

Tennessee Station.—S. E. Barnes, dairyman of the station, has been engaged by the dairy division of the Bureau of Animal Industry to do field work in Tennessee in the interests of dairying, in which work he will cooperate with the station. The vacancy has been filled by the appointment of J. N. Price. L. R. Neel has been appointed assistant in plat work, vice J. E. Converse, resigned to become manager of a farm in the vicinity of Knoxville.

Utah Station.—James Dryden, formerly connected with the station and more recently poultryman of the Montana Station and at present with the Cyphers Incubator Company, of Buffalo, N. Y., has been appointed poultryman, vice J. W. Bolte, resigned. C. Larsen, assistant in dairying at the Iowa College and Station, has been appointed dairyman to fill the vacancy caused by the resignation of J. A. Crockett, who will engage in private business.

Virginia College and Station.—Prof. R. J. Davidson, dean of the scientific department and chemist of the station, has severed his relations with the station in order to devote his entire time to the scientific department. The vacancy on the station staff has been filled by the appointment of Dr. W. B. Ellett, assistant chemist of the station. It is planned to reorganize the department with a first assistant and one or two laboratory assistants and to undertake new lines of investigation made possible by the Adams Act. W. L. Owen, recently appointed to take charge of the cooperative investigations in light tobacco at Chatham, Va., has resigned to accept a position in bacteriology in the Georgia Station. The vacancy has been filled by the appointment of R. P. Cocke. The State farmer's institute recently held at Roanoke was attended by 1,200 farmers, of whom 1,050 visited the college and station on a special train provided for their accommodation.

Bequest to the University of California.—The estate of the late M. Theodore Kearney, near Fresno, comprising about 5,000 acres of land, valued at nearly $1,000,000 and yielding an annual income of about $50,000, has been bequeathed to the University

of California, preferably for endowment of agricultural education and research. President Wheeler has expressed his belief that the trustees of the university will assume the responsibilities involved in accepting this trust.

International Congress of Agriculture.—The Eighth International Congress of Agriculture will be held at Vienna, Austria, May 21–25, 1907. The previous Congresses were held at Paris, 1889; The Hague, 1891; Brussels, 1895; Budapest, 1896; Lausanne, 1898; Paris, 1900, and Rome, 1903. A pamphlet has been issued giving the organization, regulations, and programme of the forthcoming congress. This contains the subjects for discussion of each of the eleven sections in which the congress is to be divided. All reports intended for the congress should be sent to the executive committee before December 1, 1906. Persons desirous of becoming members should notify the executive committee and pay the membership fee of 20 kronen ($4) before March 31, 1907. The secretary of the executive committee is Prof. Josef Häusler, Vienna, Austria, I. Schauflergasse 6.

Indian forestry college.—In order to make better provisions for research work in forestry, and to secure a permanent staff of forest experts for scientific research, as well as for training candidates for the government and state forestry service, the Imperial Forestry School at Dehra Dun, India, has been enlarged and hereafter will be known as the Imperial Forestry Research Institute and College. The college staff will include officers of the imperial service, holding the following positions: (1) Sylviculturist, who will make sylviculture his special study. (2) Superintendent of Forest Working Plans, who will collect and collate statistics of the results of forestry management throughout India. (3) Forest Zoologist, who will investigate the damages caused by insects and other pests. (4) Forest Botanist, who will study the botany of forest plants, distribution of species, diseases of forest trees, etc. (5) Forest Chemist, who will investigate the chemical properties of soils and forest produce. (6) Forest Economist, who will study economic methods of commercial timber production and marketing.

These officers, while engaged primarily in research work, will each deliver a course of lectures on his special subject in the college, and take part in the training of the students. The work of instruction, however, will for the most part be carried on by four assistant instructors.

Miscellaneous.—*Science Progress*, published in London from 1894 to 1898, has been revived under the name *Science Progress in the Twentieth Century*. The journal is to be issued quarterly. The first number contains, among others, articles on The Solvent Action of Roots upon the Soil Particles, by A. D. Hall; On the Occurrence of Prussic Acid and its Derivatives in Plants, by T. A. Henry; Some Notable Instances of the Distribution of Injurious Insects by Artificial Means, by F. V. Theobald; The Corn Smuts and their Propagation, by T. Johnson; and the Utilization of Proteids in the Animal, by F. G. Hopkins.

J. B. Mowry has been appointed commissioner of forestry in Rhode Island.

William Farrer, wheat specialist to the department of agriculture of New South Wales, died April 17, 1906. Mr. Farrer was noted especially for his work in the improvement of wheat by cross-breeding and selection, particularly in the direction of producing types resistant to rust and drought.

Prof. Gustav W. Lehman, prominent as a food chemist, died in Baltimore, August 5, 1906.

Dr. George W. Atherton, president of The Pennsylvania State College, died at that place July 24, 1906.

Last autumn, in the hope that a milder climate might be helpful, he went to southern California, where he spent the winter. Although the change for a time seemed beneficial, yet the relief proved to be but temporary. Upon his return home he gradually grew weaker until his disease culminated in death. At the last commencement, although extremely weak, he expressed a desire to meet the graduating

class and confer the degrees. This was his last public service to the institution over which he had presided for 24 years.

During his presidency the college developed from an institution with a small number of students, few buildings, and an inadequate teaching force to its present large attendance, ample equipment, and high position as an educational institution. Much of this progress was due to Doctor Atherton's indefatigable energy and intelligent interest in the development of technical education.

Doctor Atherton was born in Boxford, Mass., June 20, 1837. At the age of 12 his father died, leaving him with his mother and sister only partially provided for. His first employment was in a cotton mill, and later upon a farm. He worked his way through Philips Exeter Academy and Yale College, being graduated from the latter institution in 1863. He served in the civil war from 1861–63 as lieutenant and captain in the Tenth Connecticut Volunteers; was a teacher in the Albany Boys' Academy, 1863–67; professor in St. John's College, Annapolis, Md., 1867–68, and in the University of Illinois, 1868–69; was professor of political economy in Rutgers College, New Jersey, 1869–82; and president of The Pennsylvania State College, 1882–1906. The degree of LL.D. was conferred upon him by Franklin and Marshall College in 1883. He was one of the original organizers of the Association of American Agricultural Colleges and Experiment Stations, and was the first president of the organization.

O

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D.
Rural Engineering—S. M. Woodward.
Rural Economics—H. C. Taylor, Ph. D.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 1.

	Page.
Editorial notes:	
Land reclamation by drainage	1
The need of agricultural engineers	4
Changes in the Record	5
Recent work in agricultural science	6
Notes	99

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Determination of phosphoric acid by the citrate method, V. Schencke	6
Determination of phosphoric acid in Thomas slag, F. Westhausser	6
Phosphoric acid determination, F. Raschig	6
Pemberton method, D. J. Hissink and H. Van der Waerden	6
Quick methods for lime, potash, and phosphoric acid, E. H. Schultze	6
Maercker-Bühring solution, Wagner's citrate mixture, etc., H. Svoboda	6
Estimation of free acid in superphosphate, J. Ostersetzer	7
The determination of perchlorates, M. Dittrich and H. Bollenbach	7
Determination of perchlorates and chlorates, D. Tschernobajeff	7
Contribution to the analysis of nitrate of soda, R. Bensemann	7
New method of determining magnesium carbonate, W. F. Koppeschaar	7
Notes on the determination of nitrous acid, H. Legler	7
Electrolytic estimation of arsenic, C. Mai and H. Hurt	7
Determination of boric acid, K. Windisch	7
Gasometric determination of formaldehyde, G. E. Frankforter and R. West	7
Detection of hydrogen peroxid in milk, Utz	7
Determination of water in foods, F. G. Benedict and Charlotte R. Manning	7
Determination of water in molasses, G. Testoni	8
Commercial analysis of cane molasses. I, Optical methods, H. E. Sawyer	9
Methods of fat determination in milk, F. Friis, E. Holm, and A. V. Krarup	9
Siehler's "sin-acid" butyrometry, G. Cornalba	9
Detection of added water in milk, Utz	9

Page

Table for computing total solids and solids-not-fat in milk, Rüttner and Ulrich.. 9
Contributions to the examination of butter, M. Siegfeld..... 9
Extraction of tanning materials with various extractors, F. P. Veitch..... 9
Determination of ash in plant substances, E. Gutzeit..... 9
Sodium carbonate and oxalate in acidimetry, S. P. L. Sörensen and A. C. Andersen..... 10
Report of chemical department of Swedish Moor Culture Station, 1903–4, H. von Feilitzen..... 10
Progress in the field of agricultural chemistry during 1904, A. Stutzer..... 10
Review of foreign work in agricultural chemistry, C. W. Harrison..... 10

METEOROLOGY—WATER.

Monthly Weather Review, Vol. XXXIII, Nos. 1–3..... 10
Meteorological notes for year ending September 30, 1904, A. Lander..... 11
Periodic variation of rainfall in the arid region, W. B. Stockman..... 11
Climate of the Province of San Luis, Argentine Republic, A. L. Cravetti..... 11
Climate of Province of Buenos Ayres, Argentine Republic, R. J. Huergo..... 11
Action of cannon used for protection against hail, J. Violle..... 11
Frost protection experiment in Hohenheim, 1904..... 11
Errors in the determination of the temperature of the air, P. Borisov..... 11
Presence of formaldehyde in the atmosphere of towns, A. Trillat..... 11
Evaporation observations in the United States, H. H. Kimball..... 12
Copper as an algicide and disinfectant, G. T. Moore and K. F. Kellerman..... 12
Copper sulphate treatment for algæ at Middletown, N. Y., J. M. Caird..... 12
Interpretation of a water examination, W. P. Mason..... 12
Softening of hard water by heating it under pressure, N. Knight..... 12
Underground waters of region of Cadereita Mendez, J. de D. Villarello..... 13

SOILS—FERTILIZERS.

Investigations in soil management, F. H. King..... 13
How to build up worn-out soils, G. W. Carver..... 16
Composition of West Prussian soils, M. Schmoeger..... 16
Geological observations on analyses of some West Prussian soils, A. Jentzsch.. 16
Chemical nature of the soils of New South Wales, F. B. Guthrie..... 16
Soil investigations [in the Philippines], A. M. Sanchez..... 16
Rational classification of sand and gravel, A. Atterberg..... 16
Mineralogical analysis of soils, J. Dumont..... 16
Denitrification of soil, III, G. Ampola..... 17
Accumulation of atmospheric nitrogen, E. B. Voorhees and J. G. Lipman..... 17
Absorptive property of the leaf cover of the soil of forests, E. Henry..... 17
Varying absorbent power of soils for bone superphosphate and mineral superphosphate, C. Montanari..... 17
Agricultural phosphate, Bachmann..... 17
Fertilizer experiments with calcium cyanamid, H. von Feilitzen..... 17
Manurial experiments with calcium cyanamid and garden plants, R. Otto..... 18
Action of nitrate of soda and sulphate of ammonia with lime, Bachmann..... 18
Use of leucin and tyrosin as sources of nitrogen for plants, L. Lutz..... 18
Inoculation of soil with nitrogen-fixing bacteria, A. F. Woods..... 18
Results of four years' culture and liming experiments on moor soils, B. Hardt.. 18
Injurious effect of an excess of lime applied to soil, S. Suzuki..... 18
Analyses of stone lime, prepared lime, etc., L. A. Voorhees..... 18
Analyses and other studies of West Prussian marl, M. Schmoeger..... 18
Commercial fertilizers, A. Goss and W. J. Jones, jr..... 19
Fertilizer inspection, C. D. Woods and J. M. Bartlett..... 19
Analysis of commercial fertilizers sold in Maryland, H. B. McDonnell et al.. 19
Analyses of samples of fertilizers collected [in New York]..... 19
Licensed commercial fertilizers, F. W. Woll and G. A. Olson..... 19
By-products of maritime fisheries: Fish oils and fertilizers, D. Bellet..... 19

AGRICULTURAL BOTANY.

Regeneration of seedling roots after splitting, Lura A. Warner..... 19
Notes on the regeneration of the hypocotyl of flax, Mary E. Hedden..... 19
Regeneration of the epicotyl in bean and pea seedlings, Arabel W. Clark..... 19

Page.
Different degrees of availability of plant nutrients, O. Loew and K. Aso 20
Can aluminum salts increase plant growth? Y. Yamano 20
Action of poison on plants, E. Verschaffelt 20
Concerning cauliflorous flowers and fruits, L. Buscalioni 20
Frost injuries of leaves, H. Solereder 21
Physiological drought in relation to gardening, I. B. Balfour 21
Anthocyanin and its biological significance, L. Buscalioni and G. Pollacci 21
Investigations on chlorophyll assimilation, G. Pollacci 21
Importance of removal of products of growth in assimilation of nitrogen by organisms of root nodules of leguminous plants, J. Golding 21
Fungicidal action of fungus cultures, Y. Kozai and O. Loew 22
Symbiosis between Azotobacter and Oscillaria, H. Fischer 22
Relationship of Macrophoma and Diplodia, Julia T. Emerson 22
Notes on the blackening of *Baptisia tinctoria*, Julia T. Emerson 22

FIELD CROPS.

Report of Upper Peninsula Substation for 1904 [Field crops], L. M. Geismar 22
Root systems of field crops, J. H. Shepperd 23
Hand hoeing of grains, K. Kubis 24
The influence of seed, etc., on spring wheat and barley, H. von Feilitzen 24
Influence of fallow and pea culture on nitrogen balance of soils and growth of wheat, F. Wohltmann and P. Schneider 24
Crops for the silo, W. J. Fraser 24
Manurial experiments on permanent meadow land 25
Range management in the State of Washington, J. S. Cotton 25
Alfalfa or lucern, R. A. Moore, A. L. Stone, and G. A. Olson 25
Red clover from various sources, W. M. Munson 26
Directions for breeding corn, C. G. Hopkins, L. H. Smith, and E. M. East 26
Manuring of cotton, G. P. Foaden 28
Notes on bacteria active in flax retting, M. W. Beijerinck and A. van Delden 28
Selection of seed potatoes, F. Parisot 28
Potato experiments at Parc des Princes, L. Grandeau 28
Degeneration of potatoes, P. Ehrenberg 28
Degeneration of potato varieties, R. Tuckermann 29
Commercial sugar-beet seed, J. E. W. Tracy 29
Single-germ beet seed, C. O. Townsend 29
Fertilizers and sugar beets, C. O. Townsend 30
Variety tests with sugar and fodder beets, J. Hansen and K. Hoffmann 30
Progress of beet-sugar industry in United States in 1904, C. F. Saylor 31
Beet-sugar factories in the United States and Canada 31
The beet-sugar industry of Wisconsin, F. W. Woll 31
Culture of tobacco, G. M. Odlum 32
Tobacco investigations in Wisconsin for 1903 and 1904, E. P. Sandsten 32
Tobacco investigations in Porto Rico during 1903–4, J. van Leenhoff, jr 32
Extermination of Johnson grass, W. J. Spillman 34

HORTICULTURE.

Summary of experiments in practical horticulture, W. M. Munson 34
Report of Upper Peninsula Substation for 1904 [Horticulture], L. M. Geismar 35
Asparagus culture in California, R. E. Smith 36
Tomatoes, L. C. Corbett 36
Pruning tomatoes, W. T. Macoun 36
A few notes on ginseng, M. Harrington 37
Planting-table for vegetables, E. L. Fullerton 37
Culture experiments carried out in 1904, J. Klar and O. Mende 37
The higher standard in American horticulture, G. T. Powell 37
The progress of fifty years, L. H. Bailey 37
Report of South Haven Substation for 1904, T. A. Farrand 37
Pomology as a study, R. L. Castle 38
Food constituents used by bearing fruit trees, L. L. Van Slyke et al 39
Plant-food constituents in fruits, vegetables, etc., L. L. Van Slyke et al 41
Observations on the phenology of plants at Ames, Charlotte M. King 41
Varieties of fruits in Thurgau in the year 1903, F. Schwyzer-Reber 41
New York apples, S. A. Beach 41

Page.
Phases of orchard management in Wayne County, J. Craig 41
The apple in Oregon, II, E. R. Lake 41
Abnormal quantities of starch in bruised apples, G. Varcollier 42
Experiments in girdling fruit trees, J. E. May 42
The olive tree, T. Fischer 42
The book of topiary, C. H. Curtis and W. Gibson 42
Effects produced by grafting or budding fruit trees, R. P. Speer 43
A wonder-worker of science, W. S. Harwood 43
Breeding grapes to produce the highest types, T. V. Munson 43
The grape and its development, J. C. Blair 43
Assimilation of phosphoric acid by grapes, E. Zacharewicz 43
Planting-table for flowers, L. Barron 43
Hybridization of the genus Rosa, M. Viviand-Morel 43
Pansy culture, W. Toole 43

FORESTRY.

A primer of forestry, II, Practical forestry, G. Pinchot 43
Forestry experiments, F. W. Rane 44
Shade trees of Denver, W. Paddock and B. O. Longyear 44
Shade trees and ornamental shrubs and plants, G. McCarthy 44
The planted groves of Iowa, H. P. Baker 44
What the college has done for park and forestry, L. H. Pammel 44
Our mountain chaparral, G. Robertson 45
Layering rubber trees, H. N. Ridley 45
Two little-known caoutchouc-producing lianes, E. de Wildeman 45

DISEASES OF PLANTS.

Report of the plant pathologist, E. Marchal 45
Report of the consulting botanist, W. Carruthers 45
Concerning the root rot of cotton, V. Mosseri 45
Some diseases of the potato, G. Massee 45
Potato spraying experiments in 1904, F. C. Stewart et al 46
Profits from spraying potatoes, F. H. Hall et al 46
Notes on Cobb's disease of sugar cane, E. F. Smith 46
A bacterial wilt disease of tobacco, Y. Uyeda 46
A Sclerotinia disease of tobacco, C. A. J. A. Oudemans and C. J. Koning 47
Study of diseases of some truck crops in Delaware, C. O. Smith 47
Asparagus rust in California, R. E. Smith 48
Black rot of cabbage, W. Brenner 48
Bacterial disease of cauliflower and allied plants, F. C. Harrison 48
Notes on a disease of cucumbers, P. Mazé and H. T. Güssow 48
Apple scab and cedar rust, R. A. Emerson 49
Apple and pear scab, M. C. Cooke 49
The brown or bitter pitting of apples, G. Quinn 49
A fruit disease caused by *Fusarium putrefaciens* n. sp., A. Osterwalder 50
Notes on canker and gummosis of fruit trees, J. Brzezínski 50
A new disease of figs 50
Wither-tip and other diseases of citrus fruits, P. H. Rolfs 50
Notes on the Gloeosporium disease of red currants, R. Laubert 50
American gooseberry mildew in Europe, E. S. Salmon 50
Fungus diseases of the cranberry, C. L. Shear 51
Preventive treatment of grape anthracnose, L. Degrully 51
Diseases of cocoanuts 51
An injurious disease of larch, C. A. J. A. Oudemans 51

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Economic value of our native birds, H. A. Surface 51
Slugs and snails 51
Reports of deputy commissioner of horticulture, A. Craw and E. M. Ehrhorn 52
Condition of orchards and nursery stock in Utah and Oregon, J. Isaac 52
Bug *v.* bug, J. Isaac 52
The cotton worm, G. P. Foaden 52
The cotton bollworm in Georgia, R. I. Smith 52
Beet worms and their remedies, C. P. Gillette and S. A. Johnson 52

Page.
The destruction of locusts, C. W. Mally 53
Biology of brown-tail moth and account of its ravages, A. Y. Grevillius 53
Bembecia marginata in western Washington, W. H. Lawrence 54
Injuries caused by *Lytta vesicatoria* to flowers of olive, D. Mariani 54
The orange maggot, A. L. Herrera 54
The Morelos orange maggot, E. Cooper 54
A new enemy of oranges, P. Marchal 54
The pineapple gall of the spruce, E. R. Burdon 54
North American Phylloxerinæ affecting Hicoria and other trees, T. Pergande. 55
A treatise on spraying, J. M. Stedman 55
Spraying tall trees, J. A. Pettigrew 55
Composition of the lime, sulphur, and salt wash, J. K. Haywood 55
An inquiry into the cyanid method of fumigating nursery stock, W. Newell.. 56
Notes on a light trap in Hertfordshire, P. J. Barraud 56
Report of New Jersey Station upon mosquitoes, J. B. Smith 56
Sulphate of copper for destruction of mosquito larvæ, A. H. Doty 57
Effect of *Aspergillus niger* and *A. glaucus* on the larvæ of Culex and Anopheles, B. Galli-Valerio and Jeanne Rochaz-de Jongh 57
Microscopic mites, C. Fuller 57
Cattle ticks and blood-sucking flies of Dutch East Indies, J. C. Koningsberger. 57
The biology of ticks, P. Mégnin 57
Notes on Ixodidæ, L. G. Neumann 58
Experiments regarding the attraction of flowers for bees, Josephine Wery 58
A practical manual of sericulture, H. L. A. Blanchon 58
Attempts to increase the amount of silk in cocoons, F. Lafont 58
Spider-spun silk, W. H. Hunt 58

FOODS—HUMAN NUTRITION.

Potatoes: A cooking test 58
Does an egg change in weight in cooking? L. Camus 59
The "yolk cure" in the treatment of the underfed, H. Stern 59
Examination and valuation of raspberry juice, P. Buttenberg 59
Examination and valuation of candied coffee, E. Orth 59
Note on a vegetable cheese from Kamerun, W. Busse 59
Studies of arsenic in a number of food products, F. Bordas 59
Expenses for food in laborers' budgets, E. Lavasseur 59
Legislation relating to commerce in food products 59
The value of nutrients 59
Criticism of dietary standards, L. Pascault 60
Absorption and utilization of proteids, L. B. Mendel and E. W. Rockwood ... 60
Passage of different food stuffs from the stomach, W. B. Cannon 60
Excretion of carbon dioxid in bicycling, G. O. Higley and W. P. Bowen 61
The minimum amount of protein in the daily diet, H. Labbé 62
The minimum amount of nitrogen required per day, A. Gautier 62
An excess of chlorin in the diet for fifty-one days, L. Ambard 62

ANIMAL PRODUCTION.

Feeding of farm animals, O. Kellner 63
Feeding-stuff inspection, C. D. Woods and J. M. Bartlett 63
Low grade and high grade cotton-seed meal compared, J. M. Bartlett 64
Licensed concentrated feeding stuffs, F. W. Woll and G. A. Olson 64
Cost and value of concentrated feeding stuffs, G. Faye 64
Identification and adulteration of feeding cakes, G. D'Ippolito 64
Poisonous Italian linseed cakes, J. Hughes 64
Peat-molasses, H. Pellet 64
The value of amids in animal nutrition, W. Völtz 64
Grape pomace in the feeding of farm animals, H. Blin 65
Feeding experiments with rough cotton cakes, D. A. Gilchrist 65
Feeding value of swedes, D. A. Gilchrist 65
Digestibility of vetch hay and corn silage, J. Withycombe and A. L. Knisely.. 65
The prickly pear and other cacti as food for stock, D. Griffiths 65
Feeding steers on sugar-beet pulp, etc., W. L. Carlyle et al 66
Cattle-feeding experiment, W. Bruce 67
Feeding cattle different quantities of concentrated foods, T. Winter 67
Sheep breeding experiments, T. Winter 67

Page

Breeding experiments for early fat lambs, P. H. Foulkes and W. Vaughan... 67
Breeding for fat lambs, W. T. Lawrence ... 68
Feeding experiments with lambs, 1903–4, B. C. Buffum ... 68
Sheep-feeding experiment, W. Bruce ... 68
Cotton-seed oil in lards, A. D. Emmett and H. S. Grindley ... 69
Feeding farm horses, L. A. Merrill ... 69
Poultry culture in Minnesota, C. S. Greene ... 69
Poultry under confinement, J. Withycombe ... 69
Winter egg production, J. Dryden ... 69
The dry feeding of chickens, E. Brown ... 70
Modifications of the respiratory quotient due to age, L. Mayer ... 70

DAIRY FARMING—DAIRYING.

Investigations on the secretion of milk, G. Fingerling ... 70
Scant *v.* ample rations for dairy cows, H. Isaachsen ... 70
Feeding sugar to milch cows, E. A. Bogdanov ... 71
Effect of corn silage on the flavor of milk, W. J. Fraser ... 71
Influence of feeding sesame cake on properties of butter fat, J. Denoël ... 71
The different portions of the milking, H. Svoboda ... 71
The influence of milking on the composition of milk, M. Popp ... 72
Chemical composition of milk in Milan, 1902–3, C. Bertocchi ... 72
Milk supply of twenty-nine southern cities, C. F. Doane ... 72
The production of certified milk on the Biltmore farms, M. N. Ross ... 73
The sanitary production and sale of milk, Plehn ... 73
Stable hygiene, R. Bissauge ... 73
Variation in the composition of cows' milk, C. Crowther ... 73
Contribution to the bacteriology of milk, S. Severin and L. Budinoff ... 73
Gas-producing bacteria and effect on milk and its products, F. C. Harrison ... 74
Study of gas-producing bacteria found in milk, F. C. Harrison ... 74
Preservation of milk with hydrogen peroxid, E. Baumann ... 74
Preservation of milk with formaldehyde, L. Schaps ... 75
Milk preserved with formalin, P. Somerfeld ... 75
Passage of antibodies into the milk and their absorption, De Blasi ... 76
Passage of agglutinins and antitoxins of tuberculosis into milk, F. Figari ... 76
Outbreak of sore throats due to infected milk ... 76
Fat content of human milk, P. Reyher ... 76
Fat in human milk, Engel ... 77
Productive capacity of the Friesian milch sheep, A. Kirsten ... 77
Information concerning the milch goats, G. F. Thompson ... 77
The struggle against tuberculosis in Denmark, M. Beau ... 77
Mechanical splitting-up of the fat globules in cows' milk, C. Barthel ... 77
Various dairy trials, F. Friis and H. P. Lunde ... 77
Clean skimming of milk at different temperatures, F. Friis and E. Holm ... 78
A new centrifugal churn, G. Ragondet and M. Hardy ... 78
The perpetuation of pure cultures for butter starters, E. F. Pernot ... 79
Proteids in relation to mottled butter, L. L. Van Slyke and E. B. Hart ... 79
Camembert type of soft cheese in United States, H. W. Conn, C. Thom, et al. 79
Cheese-ripening materials, F. Reiss ... 80
Standards for grading cheese and creamery butter, J. A. Ruddick ... 80
Fifteenth annual meeting of Missouri State Dairy Association, 1905 ... 80
Dairying as a profession, G. L. McKay ... 80

VETERINARY MEDICINE.

Proceedings of the American Veterinary Medical Association ... 80
Symptomatology and diagnosis of animal diseases, C. Cadéac ... 81
Trypanosomes and trypanosomiases, A. Laveran and F. Mesnil ... 81
Diseases due to trypanosomes, L. Panisset ... 81
The cultivation of trypanosomata, R. D. Smedley ... 81
Hemorrhagic septicemiæ of domesticated animals, J. Taufer ... 81
Experiments with Spengler's formalin method, A. Dworetzky ... 82
Histological diagnosis of experimental tuberculosis, S. Arloing and J. Paviot ... 82
Influence of splenectomy on infection with tubercle bacilli, F. Arloing ... 82
Behavior of native Japanse cattle toward tuberculosis, S. Kitasato ... 82

Page.
Bacterial flora of softened tubercles in cattle, K. Oestern 83
Tuberculosis of the upper jaw bone in cattle, Liénaux 83
Tuberculosis among veal calves, E. Césari 83
Tuberculosis of cold-blooded animals, E. Küster 83
Resistance to bovine tubercle bacilli of two cattle in Marburg, A. Eber 84
Antituberculous vaccination according to von Behring, J. B. Schoffié 84
Transmission of animal tuberculosis to man by milk, Vallée and Villejean 84
The relation between human and animal tuberculosis, Dammann 85
Combating bovine tuberculosis on basis of the unity of this disease, Morey 85
Heart water in cattle, F. A. Verney 85
Rinderpest and the action of Koch's method of bile inoculation, Haedicke 85
Immunizing action of bile of cattle affected with rinderpest, C. Adani 85
The Molteno cattle disease, W. H. Chase 85
The use of serum in the practical treatment of anthrax, A. Carini 86
A polyvalent serum against anthrax and blackleg, V. Galtier 86
Disinfection of animals in preventing foot-and-mouth disease, Blume 86
Treatment of milk fever with air and iodid of potash, F. thor Straten 86
Necrotic stomatitis in calves and pigs, J. R. Mohler and G. B. Morse 86
Sheep parasite in Australia, F. W. Goding 87
Etiology of hog cholera, M. Dorset, B. M. Bolton, and C. N. McBryde 87
Virulence of cultures of bacilli of swine erysipelas, P. Gordan 88
Combating fowl cholera and swine plague, Klett and Braun 88
Bacterial pyelonephritis in hogs, E. Wyssmann 88
The external parasites of hogs, E. C. Stevenson 88
Infectious disease of horses with alterations in bones, Charon and Thiroux 89
Immunization against horse sickness by Koch method, C. E. Gray 89
Fowl plague, G. Marcone 89
Vaccination against fowl cholera by means of toxins, C. Bisanti 89
Serum inoculation for fowl cholera, T. Kitt 89

RURAL ENGINEERING.

Irrigation in Canada 90
Irrigation in the United States, Zimmermann 90
The irrigation project of the Canadian Pacific Railway 90
Irrigation in Klamath County, F. L. Kent 90
Water problems of Santa Barbara, California, J. B. Lippincott 90
The use of irrigation for different crops, E. J. Wickson 90
Geology and water resources of east-central Washington, F. C. Calkins 91
A general working plan for the irrigation farm of Berlin, A. Backhaus 91
Experiments on the irrigation farm of Berlin during 1904, A. Backhaus 91
Measuring the flow in underground streams 91
River surveys and profiles made during 1903, W. C. Hall and J. C. Hoyt 91
Relation of the law to underground waters, D. W. Johnson 91
Bibliographic review of papers relating to underground waters, M. L. Fuller 92
Lignite of North Dakota and its relation to irrigation, F. A. Wilder 92
Index to hydrographic reports, 1888 to 1903, J. C. Hoyt and B. D. Wood 92
Contributions to the study of drainage, E. Risler and G. Wery 92
Tile drainage, F. W. Taylor 92
Notes regarding sewage disposal at Paris and Berlin 92
Historic highways of America, A. B. Hulbert 93
Data on roads and pavements in Iowa 93
Improving the roads 93
Miscellaneous implements exhibited at Park Royal, 1904, J. B. Dugdale 93
Electric plows in Italy, P. Cuneo 93
The evolution of the plow 93
Plowing with a traction engine 93
On peat gas motors, Hubendick 93

RURAL ECONOMICS.

The business side of agriculture, A. G. L. Rogers 94
Influence of farm machinery on production and labor, H. W. Quaintance 94
Decline of landowning farmers in England, H. C. Taylor 95
History of agriculture in Dane County, Wisconsin, B. H. Hibbard 95

AGRICULTURAL EDUCATION.

Page.
The first book of farming, C. L. Goodrich 96
General laws relating to agricultural and mechanical land-grant colleges 96
Farm mechanics in the Nebraska School of Agriculture, J. B. Davidson 96
Prospectus of courses of instruction in poultry keeping 96
Agricultural education as a factor in developing useful men, F. H. Rankin 96
Agriculture through the laboratory and school garden, C. R. Jackson and Mrs. L. S. Daugherty 96
County normal training classes in Michigan, P. H. Kelley 97
Agriculture in Missouri schools 97
Studies suitable for elementary schools, P. Magnus et al 97
Report of Springfield Township Schools, Clark County, Ohio, A. B. Graham 97
Improvement of school buildings and grounds 97
School grounds and school gardens, R. A. Emerson 97
School gardens and elementary agriculture for the schools of Michigan 97
Children's gardens, D. J. Crosby 97
School gardens and their relation to other school work, W. A. Baldwin 97
Cornell nature study leaflets 97

MISCELLANEOUS.

Popular review of work of [New Jersey] experiment station, E. B. Voorhees 98
Experiment Station Work, XXVIII 98
Trade with noncontiguous possessions in farm and forest products, 1901–1903 98
Crop Reporter 98
Report of [Philippine] bureau of agriculture, 1904, W. C. Welborn 98
Report of the department of agronomy for 1904, J. Wolfbauer 98

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

	Page.
Alabama Tuskegee Station:	
Bul. 6, Apr., 1905	16
California Station:	
Bul. 165, Jan., 1905	36, 48
Colorado Station:	
Bul. 96, Feb., 1905	44
Bul. 97, Feb., 1905	66
Bul. 98, Mar., 1905	52
Connecticut Storrs Station:	
Bul. 35, Apr., 1905	79
Delaware Station:	
Bul. 70, Mar. 30, 1905	47
Illinois Station:	
Bul. 100, Mar., 1905	26
Bul. 101, Apr., 1905	24, 71
Indiana Station:	
Bul. 106, May, 1905	19
Maine Station:	
Bul. 113, Feb., 1905	26, 34
Bul. 114, Mar., 1905	19
Bul. 115, Apr., 1905	63, 64
Michigan Station:	
Spec. Bul. 30, Apr., 1905	37
Spec. Bul. 31, Apr., 1905	22, 35
Minnesota Station:	
Bul. 91, Oct., 1904	69
Nebraska Station:	
Bul. 88, May 9, 1905	49
New Hampshire Station:	
Bul. 118, Mar., 1905	92
Bul. 119, Mar., 1905	44
New Jersey Stations:	
Bul. 182, Mar. 3, 1905	98
Bul. 183, Mar. 4, 1905	18
New York State Station:	
Bul. 264, Mar., 1905	46
Bul. 265, Apr., 1905	39, 41
Bul. 266, Apr., 1905	19
North Dakota Station:	
Bul. 64, Mar., 1905	23
Oregon Station:	
Bul. 82, Nov., 1904	41
Bul. 83, Dec., 1904	79
Bul. 84, Mar., 1905	69
Bul. 85, Mar., 1905	65
Bul. 86, Apr., 1905	90

Stations in the United States—Cont'd.

	Page.
Porto Rico Station:	
Bul. 5, Dec., 1904 (5 cents)	32
Wisconsin Station:	
Bul. 121, Feb., 1905	25
Bul. 122, Apr., 1905	19, 64
Bul. 123, Apr., 1905	31
Bul. 124, Apr., 1905	32
Wyoming Station:	
Bul. 64, Feb., 1905	68

U. S. Department of Agriculture.

Farmers' Bul. 220	36
Farmers' Bul. 221	51
Farmers' Bul. 222	98
Rpt. 80	29, 30, 31
Bureau of Animal Industry:	
Bul. 67 (10 cents)	86
Bul. 68 (15 cents)	77
Bul. 69 (5 cents)	88
Bul. 70 (5 cents)	72
Bul. 71 (5 cents)	79
Bul. 72 (10 cents)	87
Bureau of Forestry:	
Bul. 24, pt. 2 (30 cents)	43
Bureau of Plant Industry:	
Bul. 72, pt. 3 (5 cents)	34
Bul. 72, pt. 4 (5 cents)	18
Bul. 74 (5 cents)	65
Bul. 75 (5 cents)	25
Bul. 76 (5 cents)	12
Bureau of Soils:	
Bul. 26 (15 cents)	13
Bureau of Statistics:	
Bul. 33 (5 cents)	98
Crop Reporter, vol. 7, Nos. 1–2, May–June, 1905	98
Weather Bureau:	
Bul. N (10 cents)	11
Doc. 327	12
Monthly Weather Review, vol. 33, Nos. 1–3, Jan.–Mar., 1905 (20 cents per number, $2 per year)	10

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D.
Rural Engineering—S. M. Woodward.
Rural Economics—H. C. Taylor, Ph. D.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 2.

	Page.
Editorial notes:	
A review of irrigation	105
Meeting of Agricultural Implement Manufacturers	109
Recent work in agricultural science	111
Notes	200

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Formation of oceanic salt deposits, J. H. van't Hoff	111
Determination of free phosphoric acid in superphosphates, Gerhardt	111
Determining free phosphoric acid in superphosphates, R. Zöckler	112
Tables for reckoning composition of ammoniated superphosphates, Gerhardt	112
Analysis of compounds containing nitrogen, C. Flamand and B. Prager	112
Gravimetric determination of nitric acid, A. Gutbier	112
Qualitative determination of nitric acid, G. Frerichs	112
Frerichs' method of determining nitric acid in water, Utz	112
New method for determining ammonia, A. Trillat and Turchet	112
Nitrogen iodid reaction in determining ammonia, A. Trillat and Turchet	113
New method of determining ammonia, A. Trillat and Turchet	113
On the physico-chemical analysis of cultivated soils, H. Lagatu	113
Determination of sulphur and phosphoric acid in foods, etc., W. L. Dubois	113
Analysis of wheat and flour for commercial purposes, H. Snyder	113
The separation of proteids, H. C. Haslam	113
Simple proteids and their cleavage by ferments, A. Kossel and Dakin	114
Investigations on the vegetable proteids, T. B. Osborne	114
Detection of cotton-seed oil in lard, L. M. Tolman	114
Investigations on the Gottlieb method, M. Siegfeld and W. Rosenbaum	114
Possible saponification of fat in the Gottlieb-Röse method, A. Burr	114
Identification of coloring matter in fat, H. Sprinkmeyer and H. Wagner	114
A new automatic pipette, Greiner and Friedrichs	114
Standard methods of sampling: A review with some suggestions, M. L. Griffin	114
The sampling of fertilizers, L. Grandeau	115

METEOROLOGY—WATER.

Page.
The Weather Bureau and the homeseeker, E. L. Wells 115
Meteorological observations, W. T. Ellis et al 115
Weather report, 1904, at Ontario Agricultural College, J. B. Reynolds 115
Colorado College observatory, meteorological summary for 1904 115
Meteorological observations, 1903–4, J. G. Haney and O. H. Elling 115
Meteorological observations, J. E. Ostrander et al 115
The weather during the agricultural year, 1903–4, F. J. Brodie 115
Rainfall in southern Rhodesia 115
Meteorological observations of Montdidier, H. Duchaussoy 115
Organization and conducting of meteorological observations, F. W. Toussaint 116
Islands for weather forecasting purposes, W. J. S. Lockyer 116
Régime of rainfall and of rain-bearing winds, M. Chassant 116
Duration of sunshine at Aas Agricultural College, 1897–1903, J. Sebelien 116
Distribution of photochemically active light, J. Sebelien 117
Photochemical studies of the ultraviolet part of sunlight, J. Sebelien 117
Importance of land drainage for prevention of frost, A. G. Högbom 118
Well waters from farm homesteads, F. T. Shutt 118
Ground water, M. Ringelmann 118
The natural hardness of water, E. Basch 118
Purification and sterilization of waters by means of calcium peroxid 118
Changes in bacterial content of water, B. G. Philbrick 118
Presence and distribution of nitrogen-fixing bacteria in the sea, Keutner 118

SOILS—FERTILIZERS.

Swamp soils, R. Harcourt 118
Abitibi soils, R. Harcourt 118
Soil investigations, F. T. Shutt 118
The architecture of the soil of France, O. Barré 118
Study of Belgian soils 119
Composition of the moor soils of Jönköping County, R. Tolf 119
Apple orchard survey of Wayne County, N. Y. II, Geology, W. E. McCourt 119
The control of soil moisture, F. T. Shutt and W. S. Blair 119
Absorption of water by clay, J. M. van Bemmelen 119
Use of coloring matters in soil investigations, B. Sjollema 119
Isolation of colloidal substances in soils, B. Sjollema 119
Field trials of Swedish Moor Culture Association, 1904, H. von Feilitzen 119
Some questions relating to soil culture, A. Arnstadt 119
Action of ammoniacal salts on nitrification, E. Boullanger and L. Massol 119
Nitrification, L. Grandeau 120
Nitrifying organisms, L. Grandeau 120
Nitrification in the soil.—The nitrous organism, L. Grandeau 120
Nitrogen-fixing bacteria, H. Fischer 120
The bacterial flora of the soil, L. Grandeau 120
Bacterial content of moor soils, O. Fabricius and H. von Feilitzen 120
Methods of bacteriological investigation of soils, II, F. Löhnis 120
Assimilation of atmospheric nitrogen by a peat mold, Charlotte Ternetz 120
Mutual action of plant food compounds in the soil, P. Kossovich 120
Different degrees of availability of plant nutrients, O. Loew and K. Aso 121
Determination of productiveness and food requirements of soils, J. König 121
Composts and composting, B. W. Kilgore et al 122
Fertilizers and amendments, F. T. Shutt 122
Analyses of cotton-seed meals 122
Analysis of commercial fertilizers 122
The utilization of ammonia nitrogen, A. Schäfer 122
Use of peat for transformation of calcium cyanamid, R. Perotti 122
Nitrate of soda as a means of protection against frost 122
Value of potash to farm crops, J. J. Willis 122
Availability of phosphoric acid in bone dust, T. Katayama 122

AGRICULTURAL BOTANY.

Relation of plant physiology to development of agriculture, A. F. Woods 123
Regarding the cause of sap pressure and flow in the maple, K. M. Wiegand 123
Further studies on the starch grain, H. Kraemer 123
Further observations on the nature of color in plants, H. Kraemer 123

Page.
Mutants and hybrids of the Œnotheras, D. T. MacDougal et al 124
Wild legumes of Maryland, J. B. S. Norton and E. P. Walls 124
Inoculation for the growth of legumes, F. T. Shutt 124
The proliferation of tobacco flowers, F. W. T. Hunger 124
Principles of classification of bacteria, F. D. Chester 124
The effect of freezing on bacteria, E. F. Smith and D. B. Swingle 125
The metabolism of chromogenic bacteria, M. X. Sullivan 125
Review of the *Bacillus subtilis* group of bacteria, F. D. Chester 125

FIELD CROPS.

Field experiments with farm crops, W. Saunders et al 125
Experiments at Fort Hays Station, 1902–'04, J. G. Haney and O. H. Elling 129
Report on cultural tests in 1903–4, A. Damseaux 130
Results of fertilizer experiments in progress for ten years, C. von Seelhorst 130
Tests of vitality of seed grain and other seeds, W. T. Ellis 131
Trials of varieties of barleys 131
The castor oil industry, C. M. Daugherty 131
Improved methods of corn growing and intense cultivation, J. B. Armstrong 131
Cotton cultivation 131
Relation of weather conditions to growth of cotton, J. B. Marbury 131
Cotton culture in Guatemala, O. F. Cook 131
Experiments with forage crops, J. S. Newman and W. D. Garrison 131
Forage crops. The silo, C. M. Conner 132
A bisexual hop vine, C. Brunotte 132
Influence of soil moisture on nitrogen of oat straw, C. von Seelhorst 132
Canadian field peas, T. Shaw 132
The potato, S. Fraser 132
The book of the potato, edited by T. W. Sanders 132
Potato growing in New York, J. L. Stone 133
Potato culture near Greeley, Colorado, J. M. Clark 133
Influence of nodules on roots upon composition, C. D. Smith and F. W. Robison 133
Tests of different varieties of sugar beets, R. Harcourt 134
Sugar-beet seed breeding, J. E. W. Tracy 134
Field experiments with sugar cane, C. F. Eckart 135
Improvement of tobacco by breeding and selection, A. D. Shamel 135
Selection of tobacco seed plants, A. D. Shamel 136
Growing Cuban seed tobacco in Texas, G. T. McNess and W. M. Hinson 136
Experiments in breeding tobacco, E. H. Jenkins 138
A new and valuable cover crop for tobacco fields, A. D. Shamel 138
Universal nomenclature of wheat, N. A. Cobb 138
Spraying to kill weeds, T. D. Jarvis 138

HORTICULTURE.

Opportunities in agriculture 139
Horticultural work at the Canadian Experiment Stations 139
Report of the professor of horticulture, H. L. Hutt 141
How to make a vegetable garden, Edith L. Fullerton 141
Test of the vitality of vegetable seeds, E. H. Jenkins 141
Mushroom growing for amateurs, G. F. Atkinson and R. Shore 141
The orchard and fruit garden, E. P. Powell 142
Promising new fruits, W. A. Taylor 142
New citrus creations, H. J. Webber and W. T. Swingle 142
Apple orchard survey of Wayne County, New York, G. F. Warren 143
Breeding of crossbred apples for the Canadian Northwest, W. Saunders 145
Apple culture, H. L. Hutt 145
Observations on the fertilization of peach orchards, E. H. Jenkins 145
Shipping of fruit to Winnipeg by freight, J. B. Reynolds 145
Some uses of the grapevine and its fruit, G. C. Husmann 146
Grapes cultivated in tropical countries, O. Labroy 146
Chemical study of tea industry in South Carolina, I, F. S. Shiver 146
Report on the cocoanut industry, W. S. Lyon 147
Use of the betel-nut in Dutch East India 147
Propagating trailing arbutus, H. J. Koehler 147

FORESTRY.

Page.
Forest planting and farm management, G. L. Clothier 147
Horticulture and forestry, J. G. Haney and O. H. Elling 147
Forest belts, W. T. Macoun 147
Forestry in Indiana, S. J. Record 148
The Gila River Forest Reserve 148
Forest administration in the Province of Assam, E. S. Carr 148
Report of the forest department of the Madras Presidency 148
Forest administration in the Andamans for 1903–4, B. B. Osmaston 149
Determination of timber values, E. A. Braniff 149
The red gum, A. K. Chittenden 150
The mechanical properties of red gum wood, W. K. Hatt 151
A new species of juniper for Texas, G. B. Sudworth 151
Attitude of lumbermen toward forest fires, E. A. Sterling 151
Practical results of cup and gutter system of turpentining, C. H. Herty 152
Experimental tapping of para rubber trees, R. Derry 152
Federal and State forest laws, G. W. Woodruff 153
Forest legislation in the Northwest 153
Arboretum and botanic garden, W. T. Macoun 153

DISEASES OF PLANTS.

Notes on fungus diseases for 1904, G. P. Clinton 153
Insects and fungus diseases, W. Lochhead 154
Report of the department of bacteriology, F. C. Harrison 154
Annual report of botanist, C. A. Barber 154
Sclerotium diseases of plants 154
Rusts of grain crops, J. Fletcher 155
New studies of vegetative life of yellow grain rusts, J. Eriksson 155
Dehne's disinfection machine, S. Rhodin 155
Burrill's bacterial disease of broom corn, E. F. Smith and Florence Hedges 155
Spraying potatoes for prevention of blight and rot, W. T. Macoun 155
Downy mildew, or blight, of potatoes, G. P. Clinton 156
"Wet rot" of potatoes, C. T. Musson and G. Marks 156
Downy mildew, or blight, of muskmelons and cucumbers, G. P. Clinton 156
Notes on *Pseudomonas campestris*, H. A. Harding and M. J. Prucha 157
Peach leaf-curl 157
Bacterial infection in black spot of the plum, E. F. Smith 157
The cedar and pear rust, P. Passy 157
Diseases of the grape in Ontario in 1904, W. T. Macoun 157
A fungicide for use in combating grape gummosis, de Sokolnicki 157
A coffee leaf fungus, H. N. Ridley 157
Pecan scab, W. A. Orton 158
Pests of ornamental shrubbery, M. C. Cooke 158
Bud rot of the cocoanut palm in the West Indies, E. F. Smith 158
Some diseases of loblolly pine timber, H. von Schrenk 158

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Ground squirrels and other rodent pests in Nevada, P. Frandsen 158
Prairie dogs, J. G. Haney and O. H. Elling 159
Relation of coyotes to stock raising in the West, D. E. Lantz 159
Relation of birds to fruit growing in California, F. E. L. Beal 159
Some benefits the farmer may derive from game protection, T. S. Palmer 159
Monthly bulletin of the division of zoology, H. A. Surface 159
Annual loss occasioned by destructive insects in U. S., C. L. Marlatt 159
Insect pests of house and garden, M. V. Slingerland 159
Collecting and preserving insects, F. Sherman, jr 160
Entomology in schools, H. S. Saunders 160
The colors of insects, A. U. Battley 160
How do insects pass the winter? J. Fletcher 160
Report of the entomologist, J. Fletcher 160
Common injurious and beneficial insects of Maryland, T. B. Symons 160
Miscellaneous cotton insects in Texas, E. D. Sanderson 160
The cotton bollworm, A. L. Quaintance and C. T. Brues 160

Page.
The Mexican cotton boll weevil, W. D. Hunter and W. E. Hinds 161
Present status of the cotton boll weevil in the United States, W. D. Hunter .. 161
Meeting ravages of boll weevil and some diseases of cotton, B. T. Galloway .. 161
Effect of certain arsenites on potato foliage, W. H. Jordan et al 161
Poisoning the potato beetle, F. H. Hall, W. H. Jordan, et al 162
The bulb mite, R. S. Macdougall 162
Cabbage root maggot. Poisoned bran for cutworm, W. S. Blair 162
The imported cabbage worm, F. H. Chittenden 162
The cabbage hair-worm, F. H. Chittenden 162
Biology and systematic position of *Otiorhynchus turca*, A. A. Ssilantjew 162
Insect injuries to forest products, A. D. Hopkins 162
The nut weevils, F. H. Chittenden 162
Black check in western hemlock, H. E. Burke 163
The felted beech coccus, R. Newstead 163
The chief injurious scale insects of Connecticut, W. E. Britton 163
Spraying for scale insects, H. J. Quayle 163
Insects injurious to roses, P. Lesne 163
Insecticides and fungicides, R. Harcourt 163
Bees, S. A. Bedford 163

FOODS—HUMAN NUTRITION.

Wheat and flour, R. Harcourt 163
Inspection of foreign food products, H. W. Wiley 164
Food consumption in Southern Italy, H. Lichtenfelt 165
Analyses of fresh chestnuts, B. Tomei 165
Prussic acid in cassava roots 165
The preservation of fruits and vegetables, V. Valvassori 165
The use of food preservatives, V. C. Vaughan 165
Importance of studying food in connection with nutrition, C. Nourry 165
Handbook of sanitation, G. M. Price 165
The respiration calorimeter, W. O. Atwater and F. G. Benedict 165
Approximately complete analyses of thirty normal urines, O. Folin 165
Laws governing the chemical composition of urine, O. Folin 166
A theory of protein metabolism, O. Folin 167
Course of the renal excretion of nitrogen, N. W. Schepsky 168
Work of digestive glands when different fats are eaten, A. M. Wirschubskij .. 168
Production of fat from proteid, S. P. Beebe and B. H. Buxton 168
Calcium content of different animal organs, M. Toyonaga 168

ANIMAL PRODUCTION.

Animal breeding and feeding investigations, D. E. Salmon 169
Fodders and feeding stuffs, F. T. Shutt 169
Commercial feeding stuffs 169
Commercial feeding stuffs, J. L. Hills, C. H. Jones, and F. M. Hollister 169
Commercial feeding stuffs, J. L. Hills, C. H. Jones, and F. M. Hollister 170
Sugar in the feeding of animals, E. Curot 170
Cattle industry in Germany and elsewhere, J. Hansen and A. Hermes 170
Feeding trials, J. G. Haney and O. H. Elling 170
Beef production, J. H. Grisdale 171
Experiments with steers, R. Robertson, S. A. Bedford, and A. Mackay 171
Sheep breeding experiments 172
Sheep and swine, W. Dinsmore 172
Pork production, J. H. Grisdale 172
Experiments with swine, R. Robertson, S. A. Bedford, and A. Mackay 173
Experiments with swine, M. Cumming 173
Canadian and Danish bacon, G. E. Day 174
Horses, J. H. Grisdale 174
Report of the poultry manager, A. G. Gilbert 175
Poultry, R. Robertson, S. A. Bedford, and A. Mackay 176
Poultry, W. R. Graham 176
Distribution and magnitude of the poultry and egg industry, G. F. Thompson .. 177
Early development of guinea eggs, I. Tur 177
Judging of the animal body by photogrammetric methods, E. Liebenau 177

DAIRY FARMING—DAIRYING—AGROTECHNY.

	Page.
Report of the professor of dairy husbandry, H. H. Dean	177
Dairy school bulletin	179
Dairy produce act of Queensland. Instruction to dairymen, G. S. Thomson	179
Cleanliness in dairy management, J. F. Blackshaw	179
Experiments with dairy cows, J. H. Grisdale	179
Dairy herd records, J. H. Grisdale, R. Robertson, and S. A. Bedford	179
Tests of Guernsey cows for advanced registry	179
Experiments in aseptic milking, V. Willem and A. Miele	179
The milking machine, P. H. Suter	180
Effect of the heat of cows on the composition of milk, G. Fascetti	180
Influence of food on the quality of milk, C. Quillard	180
Observations on the milk of cows in Jamaica, H. H. Cousins	180
Report on the milk of Jamaica cows, H. S. Hammond	180
Average composition of milk of sheep in Southern Sardinia, A. Sanna	180
Cellular elements in human colostrum and milk, V. Wallich and C. Levaditi	181
Leucocytes in milk and their significance, C. F. Doane	181
Experiments with Fliegel's apparatus for determining dirt in milk, J. Klein	181
Examination of Babcock test apparatus	181
Milk consumption in Lille, A. Bonn	182
Cooperative dairying in England, H. C. Fairfax-Cholmeley	182
Milk depots in Germany, von Ohlen	182
The addition of formalin to milk, H. de Rothschild	182
Investigations on presence of tubercle bacilli in milk, etc., H. Thue	182
Pasteurization of milk in feeding of infants, E. von Freudenreich	182
Pasteurization of milk for infants, Zeleński	182
Influence of heat on milk, E. Kayser	182
The value of a good separator, E. Freund	182
Butter preservatives, H. H. Dean and R. Harcourt	182
Notes on abnormal butters, L. Hoton	183
Manufacture of Parmesan cheese with pure cultures, F. Samarani	183
Micro-organisms in the cheese industry, P. Mazé	183
Twenty-eighth annual meeting of the Iowa State Dairy Association	183
Missouri State Dairy Association	183
United States and State standards for dairy products, 1905	183
Manufacture of dry wines in hot countries, F. T. Bioletti	183
Contribution to the study of wine making in Algeria, J. Bertrand	184
Orange wine, Pairault	184
Review of viticultural reviews, E. H. Twight	184
Preparation of practically sterile apple must, G. Perrier	184
Directions for the manufacture of olive oil in Algeria, P. Dumas	185
Cotton-seed products, L. L. Lamborn	185

VETERINARY MEDICINE.

The evolution of immunity, G. R. Leighton	185
The fundamental laws of immunity, A. Wolff	185
Intrauterine and extra-uterine transmission of antitoxins, P. H. Römer	185
Annual report on distribution of animal plagues in the German Empire	186
Diseases due to streptococci and their treatment, Thomassen	186
Pathogenic mucors and mucormycoses in animals and man, G. J. Barthelat	186
Tuberculosis of cattle, D. E. Salmon and T. Smith	186
Frequency of bovine tuberculosis in abattoirs and dairies, A. Conte	186
Experiments concerning tuberculosis, III, E. C. Schroeder and W. E. Cotton	186
Lesions in kidneys caused by tubercle bacilli, L. Bernard and M. Salomon	187
Dangerous properties of tuberculous meat, Vallée and Villejean	187
Value of the study of tuberculin reaction, S. Arloing	187
Two ways of treating tuberculosis in herds, H. L. Russell	187
Immunization against tuberculosis, P. Baumgarten	188
Protective vaccination of cattle against tuberculosis, F. Hutyra	188
Combating bovine tuberculosis according to method of von Behring, Ebeling	188
Anthrax in cattle, horses, and men, D. E. Salmon and T. Smith	188
Alterations in the character of the anthrax bacillus, G. Scagliosi	189
Texas fever, or Southern cattle fever, D. E. Salmon and T. Smith	189
Texas fever cattle tick: Pasture methods of eradication, H. A. Morgan	189
Experimental transmission of African coast fever by ticks, A. Theiler	189

Page.
Some diseases complicating rinderpest among cattle of India, J. D. E. Holmes. 189
Prophylactic treatment of rinderpest, G. K. Walker 189
Inflammation of the udder in cows, M. G. de Bruin 190
Diseases of the stomach and bowels of cattle, A. J. Murray 190
Intestinal coccidiosis of young cattle, L. Degoix 190
Abortion, or slinking the calf, J. Law 190
Osteomalacia, or creeps, in cattle, J. R. Mohler 190
Ophthalmia in cattle, M. R. Trumbower 190
Cattle poisoned by fresh paint, E. H. Jenkins 190
Symptoms and development of experimental sheep pox, F. J. Bosc 190
Serum treatment of sheep pox, F. J. Bosc 191
New facts concerning hog cholera, E. A. de Schweinitz and M. Dorset 191
Glanders, J. McFadyean 191
Etiology of contagious pleuro-pneumonia in the horse, M. G. Tartakovski 191
The forms of pneumonia in the horse, V. Drouin 191
Trypanosoma of dourine and its life history, A. Lingard 191
Biology of trypanosomes of nagana and mal de caderas, W. L. Jakimoff 192
Nagana infection in guinea pigs, Markl 192
Trypanosomiasis and tsetse-fly disease in French Guiana, A. Laveran 192
Equine piroplasmosis or "biliary fever," T. Bowhill 192
The diagnosis of rabies, L. Luzzani 192
Action of centrifugation of rabies virus, P. Remlinger 192
Fowl plague, E. Leclainche 192

RURAL ENGINEERING.

Irrigation work, 1903 and 1904, J. G. Henry and O. H. Elling 193
Conference on water conservation and irrigation 193
Water conservation and the equitable distribution, H. G. McKinney 193
Property in water, G. Chamier 193
Irrigation geologically considered, E. F. Pittman and T. W. E. David 193
Artesian water supply, W. G. Cox 193
Review of water conservation in New South Wales, L. A. B. Wade 193
Reservoir outlets, M. Ringelmann 193
Relation of electricity to irrigation works, T. Rooke 194
Irrigation, R. Luna 194
Filtration of public water supplies, R. W. Pratt 194
Sewage disposal, G. A. Johnson 194
The septic tank for the disposal of sewage, F. T. Shutt 194
Land disposal of garbage: An opportunity for engineers and contractors 194
Eleventh annual report of commissioner of public roads, 1904, H. I. Budd 194
The campaign for good roads 194
Road improvement in South Carolina, P. T. Brodie 194
Practical road building in Madison County, Tennessee, S. C. Lancaster 194
Road building in the far North, C. W. Purington 194
Treatise on concrete, plain and reinforced, F. W. Taylor and S. E. Thompson. 195
Reinforced concrete 195
The modern asphalt pavement, C. Richardson 195
Lime, cement, and gypsum, R. Tormin 195
Automobiles and agriculture, Fink 195
The use of the windmill in draining soils, J. Farcy 195
The Griffin mill, F. Krull 195
Silo construction, G. N. Knapp 195
Modern silage methods, T. Cherry 195
The construction of pigsties 195
The evolution of the plow, T. H. Foster 195
Grading of experimental plats at Hawkesbury Agricultural College, C. Potts. 195
Implement for plowing under manures and subsoiling, E. Bippart 195
Lightning report, J. B. Reynolds 195

AGRICULTURAL EDUCATION.

Industrial education in schools for rural communities, L. D. Harvey et al 196
Lady Warwick's farming college for girls, H. Spender 197
Agricultural education in Porto Rico, F. M. Pennock 197
Annual report of the Boston school-garden committee, 1905 197

Page.
Outlines of nature studies, W. Lochhead 198
Boys' agricultural clubs, D. J. Crosby 198
Hints for the guidance of exhibitors at school shows 198

MISCELLANEOUS.

Yearbook of the Department of Agriculture, 1904 198
Report of Connecticut State Station, 1904 198
Experiments at Fort Hays Station, 1902–'04, J. G. Haney and O. H. Elling .. 198
Seventeenth Annual Report of Tennessee Station, 1904 198
Experiment Station Work, XXIX 198
Second annual reunion of the Ohio State Board of Agriculture, etc 198
Consumers' fancies, G. K. Holmes 198
An agricultural tour in British Columbia, F. T. Shutt 199
Agricultural development in Argentina, F. W. Bicknell 199
Agricultural conditions in Argentina, C. D. Girola 199
Agricultural conditions in Province of Entre Rios, Argentina, E. S. Raña 199
State publications on agriculture, C. H. Greathouse 199
Accessions to the Department Library, January–March, 1905 199

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

California Station: Page.
Bul. 166, Apr., 1905 163
Bul. 167, Apr., 1905 183
Connecticut State Station:
Bul. 149, June, 1905 138
Bul. 150, June, 1905 136
Bul. 151, June, 1905 163
An. Rpt., 1904, pt. 4 ..... 153, 156
An. Rpt., 1904, pt. 5 ..... 114, 138, 141, 145, 169, 179, 181, 190, 198
Florida Station:
Bul. 78, Mar., 1905 132
Hawaiian Sugar Planters' Station:
Div. Agr. and Chem. Bul. 13, May 4, 1905 135
Kansas Station:
Bul. 128, Dec., 1904 ..... 115, 129, 147, 159, 170, 193, 198
Maryland Station:
Bul. 100, Mar., 1905 124
Bul. 101, Apr., 1905 160
Bul. 102, May, 1905 181
Massachusetts Station:
Met. Buls. 197–198, May–June, 1905 115
Michigan Station:
Bul. 224, May, 1905 133
Nevada Station:
Bul. 58, Mar., 1905 158
New York Cornell Station:
Bul. 226, Mar., 1905 ..... 119, 143
Bul. 227, Mar., 1905 141
Bul. 228, Apr., 1905 133
New York State Station:
Bul. 267, May, 1905 ..... 161, 162
Ohio Station:
Bul. 151, June, 1904 198
South Carolina Station:
Bul. 96, Feb., 1905 146
Bul. 97, Feb., 1905 122
Bul. 98, Feb., 1905 122
Bul. 99, Feb., 1905 122
Bul. 100, Feb., 1905 122
Bul. 101, Mar., 1905 122
Bul. 102, Mar., 1905 122
Bul. 103, Apr., 1905 131
Bul. 104, Mar., 1905 122
Bul. 105, Mar., 1905 122
Bul. 106, Mar., 1905 122

Stations in the United States—Cont'd.

South Carolina Station—Cont'd. Page.
Bul. 107, Apr., 1905 122
Bul. 108, Apr., 1905 122
Tennessee Station:
Bul., vol. 18, No. 1, Jan., 1905 189
Seventeenth An. Rpt., 1904 198
Vermont Station:
Bul. 109, Sept., 1904 169
Bul. 110, Dec., 1904 170
Wisconsin Station:
Bul. 125, Apr., 1905 195
Bul. 126, June, 1905 187

U. S. Department of Agriculture.

Farmers' Bul. 223 160
Farmers' Bul. 224 132
Farmers' Bul. 225 198
Farmers' Bul. 226 159
Yearbook, 1904 (65 cents) 114, 115, 123, 131, 133, 134, 135, 139, 142, 146, 147, 149, 151, 159, 161, 162, 164, 165, 169, 194, 198, 199
Bureau of Animal Industry:
Bul. 52, pt. 3 (5 cents) 186
Circ. 65 190
Circ. 66 190
Circ. 67 190
Circ. 68 190
Circ. 69 189
Circ. 70 186
Circ. 71 188
Circ. 72 191
Circ. 73 177
Circ. 74 185
Bureau of Entomology:
Bul. 50 (25 cents) 160
Bul. 51 (15 cents) 161
Circ. 60 162
Circ. 61 163
Circ. 62 162
Forest Service:
Bul. 57 (15 cents) 153
Bul. 58 (5 cents) 150, 151
Circ. 34 152
Bureau of Soils:
Bul. 27 (5 cents) 136
Library:
Bul. 54 (5 cents) 199

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D.
Rural Engineering—S. M. Woodward.
Rural Economics—H. C. Taylor, Ph. D.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 3.

Editorial notes:	Page.
Definite practical aim in experiment station work	209
The editing of station publications	211
The inauguration of President James	213
Cornell College of Agriculture and its new board of visitors	215
Recent work in agricultural science	217
Notes	308

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Determination of phosphoric acid, G. P. Baxter and R. C. Griffin	217
Determination of citrate-soluble phosphoric acid in superphosphate, O. Seib	217
Determination of phosphoric acid, F. Raschig	218
Detection of natural phosphates in phosphatic slags, L. Ledoux	218
A new reagent for potassium, E. P. Alvarez	218
Contribution to the analysis of nitrate of soda, R. Bensemann	218
The analysis of cyanamid, R. Perotti	218
The quantitative estimation of nitric acid and nitrates, W. H. Easton	218
Determination of nitrites in waters, W. P. Mason	219
The rapid analysis of baking powders, R. O. Brooks	219
Analysis of formaldehyde sold in North Dakota, E. F. Ladd	219
Detection of adulteration in maple sugar and sirup, C. H. Jones	219
Determination of fat in milk poor in fat, T. S. Thomsen	220
Study of Hubl, Hanus, and Wijs methods of iodin absorption, H. L. Wilson	220
Some notes concerning Halphen's test for cotton-seed oil, E. Fulmer	220
Reaction of lard from cotton-seed meal fed hogs, E. Fulmer	220
Precipitation limits of some vegetable proteins, T. B. Osborne and I. F. Harris	220
The glycocoll content of different proteids, F. Dubrowin	220

Page.

Determination of hippuric acid in urine, R. E. Stallings 220
Ten lectures on biochemistry of muscle and nerve, W. D. Halliburton 221
Miscellaneous analyses, C. H. Jones and F. M. Hollister 221
Report of the chemist: Division of foods and feeding, J. B. Lindsey 221
Report on general work in the chemical laboratory, C. A. Goessmann 221
Convention of Association of Official Agricultural Chemists, 1904 221

METEOROLOGY—WATER.

Monthly Weather Review, Vol. XXXIII, Nos. 4–5 221
Summaries of temperatures, rainfalls, and sunshines, E. F. Ladd 222
Meteorology, T. M. Carpenter 222
Weather of 1904, S. Blore 223
Climatological data for the year 1904 223
Results of meteorological observations in the year 1902 223
Meteorology, P. Bonâme 223
The weather 1904–5, F. J. Plymen 223
Temperature McGill College grounds, C. H. McLeod and H. T. Barnes 224
Papers and charts relating to meteorology, G. Hellmann 224
Influence of small lakes on local temperature conditions, J. L. Bartlett 224
The sun and nature, C. Flammarion 224
The farmer and the weather map, H. H. Lyon 224
Weather forecasts in the service of agriculture, Grohmann 225
Fake weather forecasts, F. J. Walz 225
Significance of *Bacillus coli* in potable waters, H. Vincent 225

SOILS—FERTILIZERS.

The principal soil areas of Iowa, W. H. Stevenson et al 225
Soils, H. Ingle 226
Some soil analyses, A. Pardy 226
Results obtained in examination of thin layers of soil, A. Delage and H. Lagatu. 226
Classification and nomenclature of soils, H. Lagatu 226
Soil temperatures, S. Blore 226
The percolation of rain water through soils, W. F. Sutherst 226
The alkali soils of Montana, F. W. Traphagen 226
Nature and treatment of alkali spots, L. E. Kelsey 227
Ant heaps, H. Ingle 227
Accumulation of fertility by land allowed to run wild, A. D. Hall 227
Manurial requirements of the Leonardtown loam soil, F. D. Gardner 227
How can we maintain the fertility of our Colorado soils? W. P. Headden ... 229
Soil fertility, W. C. Welborn 229
Fertilizers registered for sale in Arkansas during 1905, A. M. Muckenfuss 229
Analyses of fertilizers, C. A. Goessmann 229
Analyses of commercial fertilizers and manurial substances, C. A. Goessmann. 229
Official inspection of commercial fertilizers, 1904, C. A. Goessmann 229
Analyses of miscellaneous fertilizer materials, M. S. McDowell 229
Commercial fertilizers, J. L. Hills, C. H. Jones, and F. M. Hollister 230
Commercial fertilizers, J. H. Stewart and B. H. Hite 230
Manures, F. T. Holbrook and E. J. Russell 230
Amount of oil in cake and farmyard manure, G. J. Goodwin and E. J. Russell. 230
Utilization of blood in agriculture, A. Grau 231
Lime nitrogen 231
Experiments with lime nitrogen on fodder beets, C. Aschman 231
New land, lime, and litmus, W. A. Sherman 231
Liming experiments of the agricultural society of Saxony 231
Retrogression of soluble phosphates in mixed manures, G. Gray 231
Plant peculiarities as shown by the influence of sodium salts, H. J. Wheeler. 232

AGRICULTURAL BOTANY.

Quack and wheat grasses, L. H. Pammel 233
Soil-binding grasses, L. H. Pammel 233
Studies of Mexican and Central American plants—No. 4, J. N. Rose 233
Useful plants of the island of Guam, W. E. Safford 233
The respiration of plants, H. Marshall Ward et al 234

FIELD CROPS.

	Page.
Report of the agriculturists, W. P. Brooks, F. R. Church, and S. B. Haskell	234
Field experiments for 1903, W. R. Perkins	235
Report of work at McNeill Branch Experiment Station, E. B. Ferris	236
[Report on field corps], J. H. Shepperd	236
The Edgeley Subexperiment Station, O. A. Thompson and J. H. Shepperd	238
Field experiments in Staffordshire and Shropshire	238
Memoranda of plans for arid farm investigations	239
Effects of manures throughout rotations of crops, D. A. Gilchrist	239
Forage crops, E. R. Lloyd	239
Wyoming forage plants, H. G. Knight, F. E. Hepner, and A. Nelson	240
[Experimental work upon weeds and forage plants], L. R. Waldron	240
Inspection of grass and clover seed, L. R. Jones and W. J. Morse	241
Grain score cards, J. H. Shepperd	241
Variety tests of wheat, oats, and potatoes, G. C. Watson and A. K. Risser	241
Alfalfa in Vermont, J. L. Hills and L. R. Jones	242
Improvement in the quality of barley in Austria, J. Stoklasa	242
Analysis of individual stalks of corn, E. F. Ladd	243
The work on flax, H. L. Bolley	243
Fertilizer experiments with hemp, Kuhnert	243
The potato and its culture, W. T. Macoun	243
Variety tests with potatoes in 1901–1904, G. Martinet	244
Solanum commersoni and its variations at Verrières, Labergerie	244
Correlative changes in rye breeding, K. von Rümker	244
Method of tobacco seed selection, W. W. Cobey	245
Tobacco experiments, W. Frear	245
Experiments with fertilizers on tobacco, C. E. Thorne	245
Experiments in fertilizing tobacco, C. Dusserre	245
Winter wheat, T. L. Lyons and A. Keyser	246
The yautias, or taniers, of Porto Rico, O. W. Barrett	246

HORTICULTURE.

Report of the horticulturists, F. A. Waugh and G. O. Greene	247
Horticultural department, C. B. Waldron	249
Report of the horticulturist, W. Stuart	249
The real Luther Burbank, E. J. Wickson	250
Bud variation. Facts that prove its occurrence, O. W. Blacknall	250
Asparagus growing in Arkansas, E. Walker	251
Asparagus and salt, E. Walker	251
Onions and bunch crops at Beeville, J. K. Robertson and E. C. Green	251
Rhubarb in Arkansas, E. Walker	253
Pruning; wounds and their treatment; pruning tools, H. H. Hume	253
Nitrate of soda as a fertilizer for fruit trees, B. Trenkner	253
A straw mulch in the orchard, U. T. Cox and W. J. Green	253
Plums in South Dakota, N. E. Hansen	253
Keeping apples, J. C. M. Johnston	254
Small fruits in 1903, J. P. Pillsbury	254
The ferment of the tea leaf, III, H. H. Mann	254
Growing chrysanthemums for a retail trade, F. Canning	255

FORESTRY.

Trees, a handbook of forest-botany, H. Marshall Ward	255
Forest preservation and national prosperity	255
European study for foresters, T. S. Woolsey, jr	256
The forest flora of New South Wales, J. H. Maiden	256
Timber resources of Liberia, E. Lyon	256
Planting red pine	256
Pitch pine in Pike County, Pennsylvania, J. Bentley, jr	256
Cultivation of the cinchona tree in Java, R. M. Bartleman	257
Zapote tree and chicle gum, A. J. Lespinasse	257
Guayule and its economic importance, R. Endlich	257
Caoutchouc plants, an agricultural-geographical study, P. Reintgen	258
Eucalyptus screens as fire protection belts	258
A successful root-pruning device, L. C. Miller	258
The movement of wood prices and its influence, B. E. Fernow	258

DISEASES OF PLANTS.

Page.
Report of the botanists, G. E. Stone and N. F. Monahan 259
Report of the botanist, H. L. Bolley 260
Report of the botanists, L. R. Jones and W. J. Morse 261
New work upon wheat rust, H. L. Bolley 261
Report on the root-rot investigations, Z. Kamerling 262
Smut preventives and their effect on germination of grain, R. W. Peacock 262
Disease-resistant potatoes, W. Stuart 262
Potato rot in New Zealand, C. T. Musson 263
Diseases of melons and cucumbers during 1903 and 1904, J. L. Sheldon 263
Bacteria in relation to plant diseases, E. F. Smith 263
Apples injured by sulphur fumigation, H. J. Eustace 264
Spraying grapes for black rot, G. C. Butz 264
The powdery mildews of Washington, W. H. Lawrence 264
The powdery mildew, O. Butler 264
Fungi causing anthracnose of sweet pea and bitter rot of apple, J. L. Sheldon 264

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Kansas mammals in their relation to agriculture, D. D. Lantz 265
Seventeenth annual meeting of the Association of Economic Entomologists 265
Report of the entomologists, C. H. and H. T. Fernald 265
Report of entomologist, G. W. Herrick 265
Second annual report of the State entomologist, R. A. Cooley 266
Report of the government entomologist, C. P. Lounsbury 266
Annual report for 1904 of the zoologist, C. Warburton 266
The Hessian fly 266
Julus impressus in the corn field, F. M. Webster 266
The wormy apple, A. L. Melander 266
The struggle with the codling moth, W. Lochhead 267
The codling moth, W. J. Green and J. S. Houser 267
Preliminary report on the codling moth in the Yakima Valley, E. Jenne 267
Some destructive grape pests in Ohio, A. F. Burgess 267
The most effective insecticidal treatment for the white fly, W. Stuart 267
Recent invasions of forest insects in Lorraine, E. Henry 267
The elm leaf beetle, A. F. Burgess 268
The cocoanut beetle 268
Thrips and black blight, H. A. Ballou 268
The sheep maggot fly 268
Preparation and use of sprays; spray calendar, W. Stuart 268
Electrical destruction of animal life 268
Influence of stimulating food upon egg laying of queen bees, Sylviac 268
Regeneration of the thoracic feet of the silkworm, E. Verson 268
External characters which indicate sex in larvæ of the silkworm, E. Verson 268

FOODS—HUMAN NUTRITION.

Macaroni wheat, J. H. Shepard 269
Report of the food commissioner, E. F. Ladd 270
Food inspection, C. D. Woods and L. H. Merrill 270
Saxony regulations regarding sale of foods, etc., E. Wimmer 270
Examination of spices, W. Frear, H. L. Wilson, and R. E. Stallings 270
The value of condiments in the diet, O. Liebreich 271
The need of sulphur in the diet, von Oefele 271
Protein synthesis in the animal body, V. Henriques and C. Hansen 271
Chemistry of peptic and tryptic digestion of proteids, II, D. Lawrow 271
The presence of hexon bases and acid amids in meat, E. Zunz 271
Physiology of muscular work, J. M. Lahy 272
The ash constituents of feces, von Oefele 272
The mucin content of feces, von Oefele 272

ANIMAL PRODUCTION.

Studies upon the composition of timothy hay, W. Frear et al 273
Composition and nutritive value of oats, F. Tangl, M. Korbuly, and S. Weiser 274
Sorghum seed as a feeding stuff, F. Tangl, S. Weiser, and A. Zaitschek 274

Page.
The digestibility of galactan, J. B. Lindsey 274
Composition and digestibility of distillers' dried grains, A. K. Risser 275
Respiration calorimeter at Pennsylvania Experiment Station, H. P. Armsby .. 275
Condimental feeds and condition powders, J. P. Street 275
Concentrated feeding stuffs, J. P. Street, W. P. Allen, and V. J. Carberry 276
Analyses of miscellaneous feeding stuffs, M. H. Pingree 276
Commercial feeding stuffs, H. J. Wheeler et al 276
Security stock food, E. F. Ladd 276
Principles of feeding and physiology of metabolism of farm animals, F. Tangl .. 277
Live-stock score cards 277
Calf rearing, W. T. Lawrence 277
Calf-feeding experiments, J. Mahon 277
Raising calves on skim milk and pasture, J. S. Moore 277
How four hundred calves were wintered on ensilage, H. Jones 277
Experiments in beef production, W. J. Kennedy et al 277
Experiments with cattle, E. R. Lloyd 278
Steer-feeding experiments, G. H. True, T. F. McConnell, and R. H. Forbes .. 278
Methods of steer feeding: Barn *v.* seed, T. I. Mairs and A. K. Risser 279
Digestion experiments with sheep, J. B. Lindsey et al 279
Effects of feeding cotton-seed meal upon health of animals, E. Fulmer 280
Cotton-food products in hog feeding, R. R. Dinwiddie 280
Experiments with hogs, E. R. Lloyd 282
Feeding pigs on skim milk and pasture, J. S. Moore 282
The horse, I. P. Roberts 282
Blomo feed for horses, J. B. Lindsey and P. H. Smith 283
Poultry experiments, W. P. Brooks, F. R. Church, and S. B. Haskell 283
Poultry report for 1904 284
A hatching experiment, W. F. Brittin 284

DAIRY FARMING—DAIRYING.

Feeding trials with cows, J. L. Hills 284
A comparison of feeding-trial methods, J. L. Hills 285
Record of the station herd for 1903–4, J. L. Hills 285
Report of dairy departme t, J. S. Moore 285
Forage and soiling experiments, 1903, G. C. Watson and T. I. Mairs 285
The feeding value of apple pomace, J. B. Lindsey 286
A milking machine that promises to be a success, H. H. Lyon 286
Composition of cow's milk from different quarters of the udder, R. Hanne ... 286
Influence upon milk of food fat and other constituents, A. Morgan et al 286
The chemistry of cow's milk, L. L. Van Slyke 287
On the origin of lactose, C. Porcher 287
The presence of ammonia in milk, A. Trillat and Sauton 287
Are nitrates eliminated by the mammary gland? M. Henseval and G. Mullie. 288
The fat of top milks, J. W. England and C. H. La Wall 288
Biological and biochemical studies of milk, C. J. Koning 288
Does centrifuging lessen the number of bacteria in milk? S. A. Severin 288
Effect of heat on cow's milk, O. Jensen and E. Plattner 289
Sterilization of milk with hydrogen peroxid, M. Lukin 290
Preservation of milk with formalin, H. de Rothschild and L. Netter 290
The ripening of Hartz cheese, C. H. Eckles and O. Rahn 291
Micro-organisms in the cheese industry, P. Mazé 291
Condensed milk, C. D. Holley 291
Some observations on milk powder, O. Jensen 291

VETERINARY MEDICINE.

Fungi parasitic on man and animals, F. Guéguen 291
Abstracts of work in laboratory of veterinary physiology, P. A. Fish et al 291
Annual report veterinary department of station, J. C. Robert 292
Treatment of four anemic diseases by means of artificial hemoglobin, Evers .. 292
Diseases known under the name actinomycosis, J. Lignières and G. Spitz 292
The biology of the micro-organism of actinomycosis, J. H. Wright 292
Increasing the virulence of human tubercle bacillus, D. A. de Jong 293
Experimental transmission of tuberculosis from man to cattle, A. Eber 293

Page.
The pathogenesis of tuberculosis, H. Vallée 293
Tuberculous affection of lymphatic glands of muscles in food animals, Stroh .. 293
Treatment of bovine tuberculosis by means of serum of Cuguillère, V. Faure .. 294
Protective inoculation of cattle according to von Behring, Lorenz 294
Resisting power to bovine tuberculosis of two cows, A. Eber 294
Reaction curve of tubercle bacilli from different sources, T. Smith 294
Study of tolerance of cattle for tuberculin, L. Stubbe and G. Mullie 294
Diseases of mammary gland of domestic animals, P. Leblanc 294
Milk fever and the new treatment of Schmidt and Evers, Peyronny 295
East coast fever, Jarvis 295
Methods adopted in dealing with east coast fever, S. B. Woollatt 295
Some points in connection with Rhodesian redwater, S. Stockman 295
Tests of substances for tick destruction, C. P. Lounsbury 295
Serum treatment for infectious diarrhea of calves, P. Heurgren 296
Sorghum poisoning, W. R. Perkins 296
Poisoning of cattle from *Ranunculus sceleratus*, Hönscher 296
Occurrence of filaria embryos in horses and cattle, A. E. Ten Broeke 296
Surra and the differentiation of trypanosomiases, A. Laveran and F. Mesnil .. 296
The tsetse-fly disease and immunization of domesticated animals, E. Martini . 296
Report on dourine in different breeds of equines, A. Lingard 296
The experimental diagnosis of glanders, G. Mazzini and A. Aguzzi 297
The differential diagnostic value of glanders agglutination, R. Langer 297
Post-mortem diagnosis of glanders, Breton and Cheneau 297
The prophylaxis of glanders, J. McFadyean 297
Mallein as a curative agent in the treatment of glanders, T. E. Carroll 297
Internal administration of formaldehyde by intravenous injection, H. Lomas . 298
Vaccination for swine erysipelas, Schnitki 298
The histological diagnosis of rabies, F. Abba and A. Bormans 298
The symptoms and prevention of experimental rabies, D. Konradi 298
Antirabies serum, A. Marie 298
Infection and immunity in fowl cholera, E. Weil 298
Immunization of rabbits against fowl cholera, J. C. Delfino 299

RURAL ENGINEERING.

Irrigation investigations on North Platte River, B. P. Fleming 299
Memoranda of plans for irrigation investigations 299
A crosscut excavating machine for drainage ditches 300
Contribution to the biochemistry of sewage purification, S. De M. Gage 300
Contribution to the biochemistry of sewage purification, S. De M. Gage 301
Effect of water on rock powders, A. S. Cushman 301
Construction of silos, W. J. Fraser 302
Alcohol as a motive power and its production, M. J. R. Dunstan 302
Analysis of lignite coal, E. F. Ladd 302

RURAL ECONOMICS.

Agricultural economics, H. C. Taylor 302
Agricultural cooperation in England, E. Druce 303
Employment of agricultural laborers in the United Kingdom, W. Fox 303
The economic cost of slaveholding in the cotton belt, U. B. Phillips 303
Woolgrowing and the tariff since 1890, C. W. Wright 304
Prices of certain classes of Irish agricultural products and live stock 305

AGRICULTURAL EDUCATION.

Agricultural instruction for adults in the British Empire, J. Hamilton 305
Reading-course bulletins for farmers and farmers' wives 305
Agricultural college extension, University of Illinois 305
Convention of American Agricultural Colleges and Experiment Stations 306
Ninth annual meeting of American Association of Farmers' Institute Workers . 306
Agriculture in the public schools, M. M. Parks 306
Agriculture in the rural schools, J. C. McDowell 306

Page.
Teaching agriculture in common schools, C. B. Chapman 306
Tree planting, school gardening, and schoolroom decoration in Nebraska 306
Geography, nature study, and agriculture in elementary schools, C. L. Coon . 307

MISCELLANEOUS.

Seventeenth Annual Report of Massachusetts Station, 1904 307
Seventeenth Annual Report of Mississippi Station, 1904 307
Fifteenth Annual Report of North Dakota Station, 1904 307
Annual Report of Pennsylvania Station, 1904 307
Seventeenth Annual Report of Vermont Station, 1904 307
Abstract of Seventeenth Annual Report [Vermont Station], 1904 307
Guide to grounds of experiment station at Kingston, Rhode Island 307
List of abbreviations in Experiment Station Record, E. W. Allen 307

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Arizona Station: Page.
Bul. 50, May 30, 1905 278
Arkansas Station:
Bul. 85, 1904 280
Bul. 86, 1905 ..... 229, 251, 253
Colorado Station:
Bul. 99, Mar., 1905 229
Illinois Station:
Bul. 102, June, 1905 302
Iowa Station:
Bul. 81, Apr., 1905 277
Bul. 82, May, 1905 225
Bul. 83, July, 1905 233
Kansas Station:
Bul. 129, Dec., 1904 265
Maine Station:
Bul. 116, May, 1905 270
Maryland Station:
Bul. 103, June, 1905 245
Massachusetts Station:
Bul. 103, Mar., 1905 229
Bul. 104, July, 1905 229
Seventeenth An. Rpt., 1904. 221, 229, 234, 247, 255, 259, 265, 274, 279, 283, 286, 307
Mississippi Station:
Seventeenth An. Rpt., 1904 .. 235, 236, 239, 265, 277, 278, 282, 285, 292, 296, 307
Montana Station:
Bul. 54, Oct., 1904 226
Bul. 55, Dec., 1904 266
Nebraska Station:
Bul. 89, June, 1905 246
New Jersey Stations:
Bul. 184, Mar. 28, 1905 275
Bul. 185, May 1, 1905 276
North Dakota Station:
Fifteenth An. Rpt., 1904, pt. 1 ..... 219, 222, 236, 238, 240, 241, 243, 249, 260, 276, 277, 284, 302, 307
Fifteenth An. Rpt., 1904, pt. 2 ..... 270, 291
Ohio Station:
Bul. 160, Apr., 1905 267
Bul. 161, Apr., 1905 245
Pennsylvania Station:
An. Rpt., 1904 ..... 219, 220, 222, 229, 241, 245, 254, 264, 270, 272, 275, 276, 279, 285, 307
Porto Rico Station:
Bul. 6, Apr., 1905 (5 cents) .. 246

Stations in the United States—Continued.

Rhode Island Station: Page.
Bul. 104, Feb., 1905 232
Bul. 104, Feb., 1905, App 307
Bul. 105, Apr., 1905 276
South Dakota Station:
Bul. 92, Apr., 1905 269
Bul. 93, May, 1905 253
Texas Station:
Bul. 77, Dec., 1904 251
Utah Station:
Circ. 3, Apr., 1905 239
Circ. 4, Apr., 1905 299
Vermont Station:
Bul. 111, Feb., 1905 307
Bul. 112, Apr., 1905 230
Bul. 113, Apr., 1905 268
Bul. 114, Apr., 1905 242
Bul. 115, May, 1905 262
Bul. 116, June, 1905 330
Seventeenth An. Rpt., 1904. 219, 221, 241, 249, 261, 267, 284, 285, 307
Washington Station:
Bul. 67, 1905 ..... 220, 280
Bul. 68, 1905 266
Bul. 69, 1905 267
Bul. 70, 1905 264
West Virginia Station:
Bul. 94, Dec., 1904 263
Bul. 95, Dec. 31, 1904 230
Wyoming Station:
Bul. 65, May, 1905 240
Bul. 66, June, 1905 299

U. S. Department of Agriculture.

Bureau of Chemistry:
Bul. 90 (15 cents) 221
Bul. 92 (15 cents) 301
Bureau of Entomology:
Bul. 52 (10 cents) 265
Forest Service:
Circ. 35 255
Bureau of Soils:
Circ. 15 227
Weather Bureau:
Monthly Weather Review, vol. 33, Nos. 4–5, Apr.–May, 1905 (20 cents per number, $2 per year) 221, 224
Office of Experiment Stations:
Bul. 153 (10 cents) 306
Bul. 154 (5 cents) 306
Bul. 155 (5 cents) 305
Circ. 62 307

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D.
Rural Engineering—S. M. Woodward.
Rural Economics—H. C. Taylor, Ph. D.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 4.

Editorial notes:	Page.
A review of the Department of Agriculture	313
An endorsement of additional appropriations for the experiment stations	316
The eradication of Texas fever	317
Convention of Association of American Agricultural Colleges and Experiment Stations	321
Recent work in agricultural science	333
Notes	413

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Methods of titration of phosphoric acid, O. J. Hlavnicka	333
Rapid volumetric method for phosphoric acid, W. B. Hirt and F. W. Steel	333
Solubility of lime and magnesia in solutions of sodium chlorid, E. Maigret	333
Determination of nitrogen by the Kjeldahl method, S P. L. Sorensen et al	333
Modification of Kjeldahl method for total nitrogen in urine, A. Babes	334
Volumetric determination of nitrous acid, G. Barbieri	334
Determination of ammonia in water, Cavalier and Artus	334
Determination of the organic nitrogen in potable waters, J. C. Brown	334
Report of committee on standard methods of water analysis	334
Progress in the chemistry of waters, A. Goldberg	335
Volumetric determination of reducing sugars, A. R. Ling and T. Rendle	335
A study of the hydrogen peroxid method, J. K. Haywood and B. H. Smith	335
A new method for the detection of formalin in milk, Utz	335
New method of rapid milk analysis, F. Bordas and Touplain	335
New method of milk analysis, J. Bellier	335
Chemical analysis and cryoscopy of milk, H. Lajoux	336
The Sichler "sin-acid" butyrometry, W. Schneider	336
Sulphuric acid for the determination of milk fat, M. Siegfeld	336
The estimation of fat, L. Liebermann	336
Estimation of fat in infant and invalid foods, C. B. Cochran	336
Analysis of cocoa and chocolate, F. Bordas and Touplain	336
Influence of oxidation upon constants of oils, H. C. Sherman and M. J. Falk	337
Analysis of the Mexican plant *Tecoma mollis*, L. F. Kebler and A. Seidell	337
Agricultural chemistry in the year 1904, W. Zielstorff	337

METEOROLOGY—WATER.

	Page.
Summary of weather data, 1894–1904, G. A. Crosthwait	337
Weather data, 1903–4; summary for eleven years, 1894–1904, G. A. Crosthwait	337
Meteorological observations, J. E. Ostrander and C. H. Chadwick	337
Meteorological observations, G. Ginestous	337
Meteorological and magnetic observations, L. Gangoiti	337
Routes of high and low pressures and changes resulting from them, R. A. Edwin	337
Barometer and weather, van Bebber	338
Investigation of the upper atmosphere by means of kites, W. N. Shaw et al	338
General movements of the atmosphere in winter, P. Garrigou-Lagrange	338
Use of cannons and bombs as means of protection against hail, H. Dufour	338
Bacteriological examination of water and cisterns, L. L. Lewis et al	338
Miscellaneous water analyses, A. G. Ford	339
Filtration and sterilization of water, H. Pillaud	339
Action of cupric sulphate upon bacterial life in water, H. Watkins-Pitchford	339
Use of barium carbonate for the purification of water, E. E. Basch	339
Sterilization of water by calcium peroxid, L. Freyssinge and R. Roche	340

SOILS—FERTILIZERS.

Studies on properties of an unproductive soil, B. E. Livingston et al	340
A method for the mechanical analysis of soils, T. Crook	340
Mechanical analyses of soils and subsoils by centrifugal action, J. R. Kilroe	341
Soil moisture investigations for 1904, J. D. Tinsley and J. J. Vernon	341
Soil temperatures 1903–4, G. A. Crosthwait	342
Diffusion in acid and neutral media, particularly in humus soils, H. Minssen	342
Experiments in fertilizing chernozem, V. V. Wiener	342
Soil bacteriological studies, J. G. Lipman	342
The formation of nitrates in the soil, W. A. Withers	344
Investigations relative to use of nitrogenous materials, E. B. Voorhees	344
Decomposition of lime nitrogen, F. Löhnis	345
Utilization of peat in the manufacture of ammonium sulphate, A. Doudlet	345
Loss of substances useful as plant food in moss manure, T. Macfarlane	345
The agricultural value of sodium salts, H. J. Wheeler and G. E. Adams	345
Analyses of commercial fertilizers, M. A. Scovell et al	346
Analyses of fertilizers and Paris green, W. C. Stubbs and C. H. O'Rourke	347
Inspection and analyses of commercial fertilizers, W. F. Hand et al	347
Analyses and valuations of fertilizers, J. P. Street et al	347

AGRICULTURAL BOTANY.

Physiological investigations on young shoots of the grape, E. Griffon	347
Rôle of hydrocyanic acid in green plants, M. Treub	347
The assimilation of leucin and tyrosin by plants, L. Lutz	348
Assimilation of organic nitrogenous substances by plants, L. Lutz	348
Comparative assimilability by plants of ammoniacal salts, amins, etc., L. Lutz	349

FIELD CROPS.

Report of Alaska Agricultural Experiment Stations for 1904, C. C. Georgeson	349
Annual report of Hawaii Experiment Station for 1904, J. G. Smith	350
Annual report of Porto Rico Experiment Station for 1904, D. W. May	351
Cooperative experiments in agriculture, C. A. Zavitz	351
Report on the manuring of seeds hay, 1904, W. Allan	352
Culture and fertilizer tests on heath soils, B. Hardt	352
Soiling crops, 1904, G. A. Billings	353
Alfalfa in Michigan, C. D. Smith	354
Legumes other than alfalfa, C. D. Smith	354
Trials with alfalfa, J. H. Shepperd	355
Experiments in clover growing, J. H. Shepperd	355
Corn. Field tests, J. N. Harper	356
Experiment station work in corn culture, J. I. Schulte	356
Soil improvement for the Illinois corn belt, C. G. Hopkins	356
Comparative merits of varieties of oats, 1903–4, R. B. Greig and J. Hendrick	357
Varieties of potatoes, W. Bruce	357
The manuring of swedes and potatoes, 1904, C. B. Jones	358

Page.
Quality in potatoes, J. W. Gilmore 358
Irrigation experiments of 1905, C. F. Eckart 359
Fertilizer experiments, 1897–1905, C. F. Eckart 360
Wheat growing, F. C. Burtis and L. A. Moorhouse 361
Soil treatment for wheat, C. G. Hopkins 361

HORTICULTURE.

Report of the horticulturist, B. D. Halsted 363
Report of the botanist, B. D. Halsted, E. J. Owen, and J. K. Shaw 364
Production and marketing of vegetables, D. N. Barrow and E. J. Watson 365
Where king watermelon reigns supreme 366
Fall and winter culture of Pé-tsaï, J. Curé 367
Water-cress supplies 367
An apple-orchard survey of Orleans County, G. F. Warren 367
The avocado, a salad fruit from the Tropics, G. N. Collins 368
Cooperative experiments with small fruits, H. L. Hutt 368
Influence of American stocks on the quality of wine, E. Hotter 368
Chinese fruits, G. E. Anderson 368
The preparation of fruit pulp 368
Cold storage for food and horticultural products, Valvassori 369
A new coffee from central Africa, A. Chevalier 369
How walnuts grow, J. L. Bowers and F. Gillet 369
Home-grown bulbs, A. J. Pieters 369

FORESTRY.

Report of Bureau of Forestry of Philippine Islands, G. P. Ahern 370
Examination of a forest tract in western North Carolina, F. W. Reed 370
History of Austrian forestry, Laspeyres 370
Influence of kiln-drying on germination of pine seed, Haack 370
Natural grafting, L. S. Hopkins 371
Thinning spruce, Schwappach 371
Regulation of spacing in planting and thinning spruce forests, Martin 371
Effect of forest cover upon stream flow, W. B. Greeley 371
Fire protection in the teak forests of Burma, R. S. Troup 372
Discovery of maniçoba-rubber forests in Brazil, H. W. Furniss 372
Rubber tapping in the botanic gardens, Singapore 372
Terms used in forestry and logging 373
Forestry terms in French, English, and German, J. Gerschel 373

DISEASES OF PLANTS.

Minnesota plant diseases, E. M. Freeman 373
A report on plant diseases of the State, J. L. Sheldon 373
Annual report of literature of plant diseases for 1903, M. Hollrung 373
Notes on the Erysiphaceæ of Washington, W. H. Lawrence 373
The Ustilagineæ, or smuts, of Connecticut, G. P. Clinton 374
Cultures of Uredineæ in 1904, J. C. Arthur 374
The cedar apple fungi and apple rust in Iowa, L. H. Pammel 374
Report of the mycologist, J. B. Carruthers 374
Occurrence of *Peronospora parasitica* on cauliflower, H. von Schrenk 374
Intumescences as a result of chemical stimulation, H. von Schrenk 375
Disease of cauliflower and cabbage caused by Sclerotinia, G. G. Hedgcock 375
A disease of cultivated agaves, G. G. Hedgcock 375
Fungus galls, H. von Guttenberg 375
Ripe rot, or anthracnose, of banana 376
Thrips and black blight, H. A. Ballou 376
Pod diseases of cacao 376
Witch-broom disease of cacao 376
Disease in immortelles 376
Disease of black oaks caused by *Polyporus obtusus*, P. Spaulding 376
Willow canker, T. Johnson 377
Glassy fir, H. von Schrenk 377
Corticium chrysanthemi, C. B. Plowright 377
Concerning the root rot of cotton 377

ECONOMIC ZOOLOGY—ENTOMOLOGY.

	Page.
International code of zoological nomenclature, C. W. Stiles	378
Report of the entomologist, J. B. Smith	378
Third annual report of the chief inspector	378
The arrowroot worm	378

FOODS—HUMAN NUTRITION.

Milling and chemical value of wheat, C. E. Saunders and F. T. Shutt	379
Dietetics in relation to hospitals for the insane, W. O. Atwater	380
Labels on adulterated and imitation foods, R. M. Allen	380
Protective value of proteids, H. M. Vernon	380

ANIMAL PRODUCTION.

Relative values of feeding stuffs, H. P. Armsby	380
Second report on feeding-stuff inspection, B. W. Kilgore et al	382
Investigation regarding succulence, F. W. Robison	382
The utilization of beet leaves, D. Meyer	383
Mixed farming, R. W. Peacock	383
Feeding farm animals, T. Butler and B. W. Kilgore	384
Present methods of beef production, V, H. W. Mumford and L. D. Hall	384
The making of prime Scots beef	385
Preparing corn and clover hay for fattening steers, H. W. Mumford	385
Influence of rations upon hydration of tissues, A. Gouin and P. Andouard	387
Raising calves on separator milk, H. T. French	387
Soy beans, middlings, and tankage in pork production, J. H. Skinner	387
Poultry suggestions for the amateur, C. K. Graham	388
Poultry experiments, G. M. Gowell	388
Poultry experiments, J. Dryden	390
Egg preservation, J. S. Jeffrey	392
Experiments in the artificial rearing of oyster fry, J. Nelson	393

DAIRY FARMING—DAIRYING—AGROTECHNY.

Practical guide to dairying, R. T. Archer and P. J. Carroll	394
Farm dairying, J. C. Kendall	394
Conformation and productive capacity of cattle, H. Attinger	394
Report of the dairy husbandman, G. A. Billings	394
Should dairy cows be confined in stalls? W. J. Fraser	395
Suggestions for the improvement of dairy barns, H. A. Hopper	395
Tests of materials for bedding cows, C. F. Doane	395
Concentrated feeding stuffs and stage of lactation, A. Ostermayer	395
Increasing the fat content of milk by feeding, P. Diffloth	395
Influence of asparagin on production of milk, T. Pfeiffer et al	396
Daily variations in the fat content of milk, M. Siegfeld	396
Variations in the yield and fat content of milk during one year, Harnoth	396
On the origin of lactose, C. Porcher	396
On the agricultural production of milk for infants, P. Diffloth	396
Principles and experiences in preparation of milk for infants, Backhaus	396
A discussion on infant milk depots, B. W. F. Anderson, N. Straus, et al	396
The nutritive value of sterilized cow's milk, R. Brunon	396
New methods of sterilizing milk and cream, M. Riegel	397
Chemical preservatives in milk, H. C. Sherman et al	397
Milk treated with lime-sugar solution, Lührig	397
The so-called "germicidal property" of milk, W. A. Stocking, jr	398
Chemical composition of colostrum with reference to proteids, M. Nencki	398
Milk examinations, J. Szilasi	398
Chemical investigations relating to dairying in 1904, F. T. Shutt	398
Butter investigation, H. Lührig	398
Composition of Holland butter, T. van Sillevoldt	399
Investigations on influences in Limburg affecting butter, D. Knuttel	399
Holland butter, A. Juckenack and R. Pasternack	399
Government butter control in Holland, A. J. Swaving	399
The decomposition of fats, O. Rahn	399
Characteristics of camel's butter, J. Vamvakas	399

Page.
Oïdium lactis and the ripening of cream and cheese, J. Arthaud-Berthet 399
On the action of rennet ferments on milk and casein, E. Laqueur 400
Microscopical preparations in studying cheese ripening, A. Rodella 400
Investigations in Emmenthal cheese making, E. von Freudenreich 400
Annual reports of dairymen's associations of Province of Ontario, 1904 400
Tests of new dairy apparatus at Danzig Exposition in 1904, B. Martiny 400
Casein: Its preparation and technical uses, R. Scherer 400
Progress in the manufacture of starch, H. Hanow 401
Complete treatise on the manufacture of beer, G. Moreau and L. Lévy 401
Leaching grape husks for recovery of spirit, A. J. Perkins and W. R. Jamieson 401
On the production of sweet cider, G. Warcollier 401
The national fruit and cider institute and its work, B. T. P. Barker 401
Pure cultures in vinegar making, W. Henneberg 401
Citric acid from lemon waste direct, A. Heingartner 401

VETERINARY MEDICINE.

Some important foreign veterinary investigations, E. V. Wilcox 401
Report of veterinary director-general, J. G. Rutherford 401
The actual conceptions of experimental pathology, Charrin 402
Immunization as a means of controlling contagious diseases, J. B. Tiffany 402
Anaerobic bacteria in the intestines of cattle, J. Neubauer 402
The pathogenic action of parasites in the intestines, J. Guiart 402
Infectious pneumonia of rabbits and its control, H. J. Südmersen 402
Furonculine, G. Mitrowitsch 402
Investigations concerning lysoform, B. Promnitz 402
Crude oil as a disinfectant, F. C. Quereau 403
The biology of tubercle bacilli of low virulence, J. Bartel and R. Stein 403
Immunization of cattle against tuberculosis, Libbertz and Ruppel 403
Immunization against tuberculosis by bacilli from turtles, F. F. Friedmann 403
Case of abortion and puerperal collapse due to tuberculosis, G. Ceramicola 404
Reaction to tuberculin, H. Vallée 404
Fraud in connection with tuberculin test, E. Thierry 404
Experience with a method for demonstrating anthrax, A. Marxer 404
Pyrosoma diseases of cattle, J. W. Schütz 404
Eradication of African coast fever 404
The Texas fever cattle tick situation, H. A. Morgan 404
Preventive vaccine for heartwater, D. Hutcheon 404
Pathogenesis and etiology of chronic hematuria in cattle, E. Liénaux 404
Broncho-pneumonia of cattle, P. G. Woolley and W. Sorrel 405
Cattle complaint, Desmond 405
Infectious granular vaginitis and metritis of cattle, M. G. de Bruin 405
Mammitis in cows, A. Lanfranchi 405
Specific arthritis of lambs 405
Navel ill or specific arthritis of lambs 405
Further experiment with nodule disease of sheep, W. H. Dalrymple 405
Liver rot or fluke, A. A. Brown 406
Fluke or slak in the liver of sheep, D. Hutcheon 406
Lungworm in sheep 406
Contagious abortion in sheep and goats, E. Thierry 406
Characterization of hog cholera group of bacilli, H. Smidt 406
The problem of swine plague, Schmidt and R. Ostertag 406
Serum therapy and serum vaccination against swine erysipelas, A. de Mestral 406
Vaccination for swine erysipelas, Glage 406
An improved medium for cultivating *Trypanosoma brucei*, W. J. Macneal 407
The trypanosome problem, H. Ziemann 407
Dourine, F. S. W. Baldrey 407
Virulence of a pasteurella in a horse affected with anasarca, Coquot 407
Botryomycosis in horses, P. Chaussée 407
Subcutaneous botryomycosis in the horse, Bidault 407
Transmission of glanders by a reacting horse apparently healthy, A. Conte 407
The sanitary control of glanders, V. Galtier 407
Biliary fever in the horse, A. Edington 407
So-called maxillary disease of horses and mules in Kamerun, H. Ziemann 408
Tetanus and antitetanic serum, W. H. Dalrymple 408
The virulence of the blood in rabid animals, A. Marie 408
Is rabies hereditary? D. Konrádi 408

RURAL ENGINEERING.

Page.
Report of irrigation and drainage investigations, 1904, E. Mead 408
Disposal of household wastes, R. Fletcher 409
Better roads for Missouri 410
Industrial and agricultural development, A. Chatterton 410
Hydraulic engines at the U. S. naval coaling station, Bradford, R. I 410

AGRICULTURAL EDUCATION.

Progress in agricultural education, 1904, A. C. True 410
Exhibits at the Louisiana Purchase Exposition, W. H. Evans and W. H. Beal .. 410
Annual report of farmers' institutes, 1904, J. Hamilton 410
Report of the extension work of the college, A. E. Stene 410
Agriculture at Purdue University, W. E. Stone 411
County schools of agriculture in Wisconsin, K. C. Davis 411
Elements of agriculture, J. H. Shepperd and J. C. McDowell 411
Course of study for common and graded schools of North Dakota 411
Program of studies for the common schools of New Hampshire 411
Nature study lessons for primary grades, Lida B. McMurray 412

MISCELLANEOUS.

Annual Report of the Office of Experiment Stations, 1904 412
Seventeenth Annual Report of Louisiana Stations, 1904 412
The work at the substations, L. R. Taft and C. D. Smith 412
Annual Report of New Jersey Stations, 1904 412
Experiment Station Work, XXX 412

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Connecticut Storrs Station: Page.
Bul. 36, June, 1905 388
Bul. 37, June, 1905 398
Hawaiian Sugar Planters' Station:
Div. Agr. and Chem. Bul. 14, May 26, 1905 359
Div. Agr. and Chem. Bul. 15, Aug. 2, 1905 360
Idaho Station:
Bul. 48, May, 1905 387
Bul. 49, May, 1905 ..... 337, 342
Circ. 1, 1905 337
Illinois Station:
Bul. 103, Aug., 1905 385
Circ. 93, July, 1905 395
Circ. 94, July, 1905 384
Circ. 95, July, 1905 395
Circ. 96, July, 1905 356
Circ. 97, Aug., 1905 361
Indiana Station:
Bul. 107, July, 1905 411
Bul. 108, July, 1905 387
Iowa Station:
Bul. 84, Aug., 1905 374
Kentucky Station:
Bul. 117, Dec. 31, 1904 346
Bul. 118, Mar. 1, 1905 356
Bul. 119, Apr. 15, 1905 380
Louisiana Stations:
Bul. 80 (second series) 347
Bul. 81 (second series) 365
Bul. 82 (second series) 404
Bul. 83 (second series) 405
Seventeenth An. Rpt., 1904 .. 412
Maine Station:
Bul. 117, July, 1905 388
Maryland Station:
Bul. 104, July, 1905 395
Massachusetts Station:
Met. Buls. 199–200, July–Aug., 1905 337
Michigan Station:
Bul. 225, June, 1905 354
Bul. 226, June, 1905 412
Bul. 227, June, 1905 354
Spec. Bul. 32, May, 1905 382

Stations in the United States—Continued.

Mississippi Station: Page.
Bul. 85, Oct., 1904 347
New Jersey Stations:
An. Rpt., 1904 ... 342, 344, 347, 353, 363, 364, 378, 393, 394, 412
New Mexico Station:
Bul. 54, Mar., 1905 341
New York Cornell Station:
Bul. 229, May, 1905 367
Bul. 230, June, 1905 358
North Carolina Station:
Bul. 190, May, 1905 344
Bul. 191, June, 1905 392
Bul. 192, May, 1905 394
North Dakota Station:
Bul. 65, Apr., 1905 355
Oklahoma Station:
Bul. 65, June, 1905 361
Bul. 66, June, 1905 338
Bul. 67, June, 1905 339
Pennsylvania Station:
Bul. 71, May, 1905 380
Rhode Island Station:
Bul. 106, May, 1905 345
Utah Station:
Bul. 92, Feb., 1905 390
West Virginia Station:
Bul. 96, June 30, 1905 373

U. S. Department of Agriculture.

Farmers' Bul. 227 412
Bureau of Chemistry:
Circ. 24 337
Bureau of Forestry:
Bul. 60 (5 cents) 370
Bul. 61 (5 cents) 373
Bureau of Plant Industry:
Bul. 77 (5 cents) 368
Bureau of Soils:
Bul. 28 (5 cents) 340
Office of Experiment Stations:
An. Rpt., 1904 (55 cents) . 349, 350, 351, 356, 380, 401, 408, 410, 411, 412

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D.
Rural Engineering—S. M. Woodward.
Rural Economics—R. P. Teele, M. A.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 5.

	Page.
Editorial notes:	
The Sixth International Live Stock Exposition	417
Educational influences of the exposition	418
Agricultural colleges and experiment stations at the exposition	420
Convention of Association of Official Agricultural Chemists, 1905, H. W. Lawson	423
Recent work in agricultural science	435
Notes	513

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

The practice of agricultural chemists, M. Passon	435
Determination of phosphoric acid as pyrophosphate, K. K. Järvinen	435
An alkalimetric method of determining phosphoric acid, V. Bouiez	435
Further notes on simple methods of determining potash, F. Klinkerfues	435
Determination of lime in high percentage marls, P. Sommer	435
Separation of iron and aluminum in analysis of plant ashes, P. Kaschinsky	436
Determination of loss on ignition in soil analysis, H. Mehring	436
Difficulty of detecting small variations in nitrogen content of soils, R. Thiele	436
Determination of nitric acid in presence of organic substances, B. Pfyl	436
Examination of potable waters and interpretation of results, F. Dienert	436
Estimation of cellulose and lignin in feeding stuffs and foods, J. König	436
The cleavage products of starch, A. Rössing	437
Analysis of wheat flour for commercial purposes, H. Snyder	437
Estimation of moisture in bread, A. Pagniello	437
Absolute desiccation of vegetable materials, L. Maquenne	437
The harmfulness of artificial colors in foods, G. Schacherl	437
Simple method for determining boric acid quantitatively, O. von Spindler	437
On fat determination in milk, T. S. Thomsen	437

Page.
Contribution to the detection of watered milk, O. Bialon 438
Refractometric examination of milk, M. Henseval and G. Mullie 438
Cryoscopy of milk for detecting the addition of water, C. Barthel 438
Review of the literature of milk chemistry, R. W. Raudnitz 439
Commercial utilization of milk waste, J. A. Just 439
The quantitative analysis of lard, D. Wesson and N. J. Lane 439
Chemical nature of sugar product obtained by overheating, F. Stolle 439
Experiments with caramel as a cleavage product of caramelan, F. Stolle 439
Quantity of sugar permissible in imported preserved pineapples, H. W. Wiley .. 439
Occurrence and estimation of organic acids of wines, A. Partheil 439
Household chemistry, H. T. Vulté and G. A. Goodell 440
Chemistry of the household, Margaret E. Dodd 440

METEOROLOGY—WATER.

Climate [of Idaho] 440
Account of some features of climate of Reno, Nevada, S. B. Doten 440
Work of station of agricultural climatology of Juvisy, 1904, C. Flammarion ... 440
Meteorological observations, J. E. Ostrander and C. H. Chadwick 440
Meteorological summary for 1903–4, E. Burke 440
Meteorological summary for 1903, C. A. Patton 440
Annual precipitation in Oklahoma and Indian Territory, C. M. Strong 441
Meteorological observations on Ben Nevis, Lord McLaren et al 441
Rainfall and sunshine of Guernsey for the year 1904, A. Collenette 442
Rainfall in the agricultural districts, G. G. Bond 442
Observations of atmospheric phenomena at Manila central observatory, 1903 .. 442
The heaviest rainfalls in the world 442
Weather conditions and statistics 442
Forecasting the weather and storms, W. L. Moore 442
Some aspects of modern weather forecasting, W. N. Shaw 442
Islands for weather forecasting purposes, W. E. Cooke 442
Water and agriculture, L. Thiry 443
Natural vegetation and the purity of waters, L. A. Fabre 443
Geology and underground water conditions of Jornada del Muerto, C. R. Keyes. 443
Water for domestic purposes in North Dakota, E. F. Ladd 443
The city of Paris and the water question, L. Grandeau 443

SOILS—FERTILIZERS.

Availability of potash and phosphoric acid in soil, G. S. Fraps 444
Source and importance of carbon dioxid in soil, J. Stoklasa and A. Ernest 444
Contributions to our knowledge of the aeration of soils, F. H. King 445
Influence of packing of soil on oats, C. von Seelhorst and Krzymowski 445
Bare fallow, C. von Seelhorst 445
Investigations on evaporation from soils, C. von Seelhorst 445
Percolation of rain water in sandy and loamy soils, C. von Seelhorst 445
Some agricultural and geobotanical observations, S. Kravkov 445
Distribution of the population of Sweden as determined by the geological character of the soil, C. Rabot 446
The sugar-cane soils of Jamaica, III, H. H. Cousins 446
Geological notes on cacao soils, E. H. Cunningham-Craig 446
Phosphoric acid in cultivated land in Java, T. Marr 446
Investigations on the potash content of moor soils, P. Vageler 446
The soil of the Pontine marshes, A. Orth 446
Difficulty of ascertaining the productiveness of tropical soils, A. Conturier 446
Soil analysis and value of results in fertilizing vineyards, A. Hubert 446
A new method of mechanical soil analysis, A. Sabanin 447
The bacteriological examination of cultivated soils, T. Remy 447
Soil inoculation 447
Contribution to the knowledge of nitrogen bacteria, F. Löhnis 447
Value of some new nitrogenous fertilizers, H. G. Söderbaum 447
Preservation and action of the nitrogen of urine, E. Böhme 448
Ammoniacal nitrogen as a plant food, Gerlach and Vogel 448
Ammonium salts or nitrate of soda, Clausen 448
Nitrate by-product, Aumann 449
Calcium nitrate in agriculture, E. S. Bellenoux 449

Page.
On some constituents of Manchester soot, E. Knecht 449
The Tunisian phosphates, L. Pervinquière 449
Action of organic acids on phosphates, A. Quartaroli 449
Potash for mangolds and potatoes on moor soils, A. von Feilitzen 449
Fertilizer experiments with lime, M. Hoffmann 449
Injurious effect of gypsum in vegetation experiments in zinc pots, D. Meyer .. 450
Injurious action of gypsum in vegetation experiments in zinc pots, B. Tacke .. 450
Recent investigations on the use of commercial fertilizers, Rippert 450
Analyses and valuations of commercial fertilizers, J. P. Street, et al 450
Analyses of commercial fertilizers, H. J. Wheeler et al 451
Analyses of commercial fertilizers 451
Fertilizer analyses, 1904–5, B. W. Kilgore 451
Mineral products of the United States, 1895 to 1904, D. T. Day 451
Working in Great Britain of the fertilizers and feeding stuffs act, 1893 451

AGRICULTURAL BOTANY.

Report of the botanist, J. W. Blankinship 451
The physiological effects of Bordeaux mixture, R. Schander 451
Notes on water transfer in plants, H. H. Dixon 452
On the movements of petals, Esther P. Hensel 453
Preliminary report on the Hymeniales of Connecticut, E. A. White 453
Notes on amanitas, W. A. Kellerman 453
Yellow race of *Bacillus pseudarabinus* from the quince, R. G. Smith 453
The bacterial origin of Macrozamia gum, R. G. Smith 453

FIELD CROPS.

Variety tests of grain, A. Atkinson 454
Summary of press bulletins [on field crops] 454
Field crops at Wagga Experimental Farm, G. M. McKeown 454
The improvement of poor pastures, T. H. Middleton 454
Fertilizer experiments with Jerusalem artichokes, H. Blin 455
Remarks on the "popping" of Indian corn, F. H. Storer 455
Cotton growing on sandy upland soils, G. W. Carver 455
The commercial cotton crop of 1903–4, J. L. Watkins 456
The color of hemp seed, C. Fruwirth 456
Potato culture, A. J. McClatchie 457
Sugar-beet culture, A. J. McClatchie 457
Influence of environment upon composition of sugar beet, 1903, H. W. Wiley. 457
[Cooperative tests with sugar beets and alfalfa], V. K. Chesnut 458
Culture of sugar cane and manufacture into table sirup, H. W. Wiley et al ... 458
Manurial experiments with sugar cane in Leeward Islands, 1903–4, F. Watts et al 460
Seedling and other canes in Leeward Islands, 1903–4, F. Watts et al 460
Sugar-cane experiments in Cuba 461
Variation in the chemical composition of the swede, S. H. Collins 461
The manurial requirements of the swede crop, J. Percival 461
Influence of fertilizers upon yield of timothy hay, J. W. Gilmore and S. Fraser. 461
Influence of the season on the composition of wheat, F. Wohltmann 462
A wheat with numerous aliases, C. E. Thorne 462
Mendel's laws of inheritance and wheat breeding, R. H. Biffen 462
Some practical suggestions concerning seed germination, J. J. Thornber 463
The vitality of seeds, W. J. Beal 463

HORTICULTURE.

Report of the [Oregon horticultural] commissioners, E. L. Smith et al 463
Horticulture in Oregon, H. E. Dosch 463
Horticultural department, R. W. Fisher 463
Vegetable gardening, S. B. Green 463
Forcing of tomatoes, cucumbers, and melons, C. E. Hunn and J. Craig 463
Soil treatment in greenhouse culture, H. J. Wheeler and G. E. Adams 464
Report on fruit industry of Great Britain, A. G. Boscawen et al 465
Studies on apples, W. D. Bigelow, H. C. Gore, and B. J. Howard 465

Page.
Pear culture, A. J. McClatchie 466
Japan and hybrid plums, H. N. Starnes 466
Varieties of olives called "table or pickling olives" 467
Pickling olives for home use, W. W. Skinner 467
Cultivation of oranges in Dominica, H. H. Bell 467
A new banana from Madagascar, P. Claverie 467
On the effects of ringing, Leclerc du Sablon 467
Winter storage of nursery stock, M. Cooper 467
Forcing strawberries, C. E. Hunn and J. Craig 468
Small fruit preserving in bulk 468
Electrifying grape cuttings and rooted plants, F. Honcamp 468
The wild coffees of French Guinea, A. Chevalier 468
Nut growing, J. B. Pilkington 469
A few modern peonies, G. C. Watson 469
Hybridizing the peony, G. Hollis 469
A répertoire of colors 469
What is horticulture? L. H. Bailey 469

FORESTRY.

The forest reserves of California, A. F. Potter 469
Reforesting in California, T. P. Lukens 469
Forest fires and the forest in California Sierras, W. F. Hubbard 469
Forests and forestry in Connecticut, A. F. Hawes 469
Connecticut's new forest law 470
Forest flora of the Bitter Root Mountains, L. H. Pammel 470
Forest management in Bavaria and Saxony, C. S. Orwin 470
Reports on forest administration in Burma, 1903–4, J. Copeland et al 470
Report of forest department in Bombay Presidency, 1903–4, G. P. Millett et al. 470
Rubber cultivation in the West Indies 470
The India rubber of commerce, M. Chamney 471
New trees introduced by the Government, W. H. Evans 471
An adaptation of methods in forest work, W. F. Hubbard 471

DISEASES OF PLANTS.

Diseases of the apple, cherry, peach, pear, and plum, E. M. Wilcox 471
Some bacterial diseases of plants prevalent in Michigan, W. G. Sackett 471
Fungus diseases of cotton, L. Lewton-Brain 472
A new disease in potatoes 472
A disease of potatoes 472
Blackleg in potatoes 472
Review of the principal diseases of sugar cane, L. Lewton-Brain 472
Club root in turnips 472
The cucumber leaf blotch, A. D. Hall 472
A mushroom disease 473
Three years' experiments with crown gall, G. G. Hedgcock 473
Observations on some vine diseases in Sonoma County, California, O. Butler .. 474
Fungus diseases of cacao, L. Lewton-Brain 475
A disease of conifers 475
Larch canker 475
Spraying machines, W. E. Bear 475

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Zoological yearbook, 1904, P. Mayer 475
Bobwhite and other quails in their economic relations, S. D. Judd 476
Birds known to eat the boll weevil, V. Bailey 476
Bacteria used in the destruction of rats and mice, L. Bahr 476
Entomological department, R. A. Cooley 477
A circular of information, J. Kotinsky 477
The western cricket, C. P. Gillette and S. A. Johnson 477
Leaf hoppers and their natural enemies, R. C. L. Perkins 477
Late fall spraying for the San José scale, J. B. Smith 477
Peach insects, R. I. Smith 478
The gypsy and brown-tail moths, A. H. Kirkland 478

Page.
Trypeta ludens in Mexico, J. Isaac 478
Insects of the pecan, H. A. Gossard 479
Insects injurious to forests, A. L. Herrera 479
Texas fever ticks 479
Means for the destruction of mosquitoes, A. F. Mankowski 479
Report of the inspector of fumigation appliances, 1904, P. W. Hodgetts 479
Annual report of the Beekeepers' Association of the Province of Ontario, 1904 480
Bee products in Arizona, R. H. Forbes 480
Sericulture, P. Vieil 480
The silk-growing season of 1904, G. McCarthy 480

FOODS—HUMAN NUTRITION.

Digestibility and nutritive value of bread and of macaroni, H. Snyder 481
Contamination and adulteration of bread and milling products, H. Stiegeler 481
Gluten bread 482
Malt extract in bread making, R. L. Corby 482
Wheaten flour, T. Macfarlane 482
Cereal foods, L. H. Merrill 482
Nitrogen content of barley and malt, Prior 483
Distribution of nitrogenous material in barley, E. Jalowetz 483
The purin bodies of food stuffs, I. W. Hall 483
Heat values and food values, H. P. Armsby 484
Concerning the natural feeding of infants, M. Rubner and O. Heubner 485
Concerning the mechanism of stomach digestion, P. Grützner 485
Products of digestion of the proteolytic spleen enzym, E. P. Cathcart 486
Influence of fasting and feeding, M. S. Pembrey and E. I. Spriggs 486
Concerning the metabolism of athletes, H. Lavonius 486
The toxin and antitoxin of fatigue, W. Weichardt 486
The relation of cookery to digestion, Bertha H. Bacheller 487
Shellfish and the bacilli of typhoid 487
The phosphorescence of eggs and potatoes, A. Nestler 487
Some tea curiosities, L. Lodian 487
Tea bouquets and scented tea, L. Lodian 487
The examination of the feces, I. S. Wile 487
Food investigations, V. K. Chesnut 487
Report of State analyst, R. E. Doolittle 487
Report of work in food laboratory, H. E. Barnard 487
Fifth report on food products for 1904, B. W. Kilgore 487

ANIMAL PRODUCTION.

Investigations at sugar experiment station laboratory, 1904, C. A. Browne, jr 488
Report upon properties and utilization of rice oil, C. A. Browne, jr 489
Composition of concentrated feeding stuffs on sale in Florida, A. W. Blair 489
Commercial feeding-stuff law, B. E. McLin 490
Commercial stock feed, E. E. Rose 490
Inspection of feeding stuffs 490
Singed cacti as a forage, J. J. Thornber 490
Animal breeding and feeding investigations, D. E. Salmon 490
Effect of lecithin on proteid metabolism, W. Völtz 490
Influence of different proteids upon nitrogen metabolism, W. Völtz 491
Action of intestinal juice on enteric secretion, A. Frouin 491
Does pancreatic juice contain lactase? H. Bierry 491
The proper utilization of food stuffs, A. M. Soule 491
Assimilation of calcium and phosphorus, A. Köhler et al 491
Feeding steers on sugar-beet pulp, etc., W. L. Carlyle and C. J. Griffith 491
Prolificacy with ewes and breeds of sheep, C. S. Plumb 492
The principles and practice of horse breeding, A. S. Alexander 492
The feeding of molasses to work stock, W. H. Dalrymple 492
The crate-fed chicken industry, F. C. Hare 492
Turkeys, from shell to market, J. C. Clipp 493
Influence of feeding sesame cake on the properties of butter fat, J. Denoël 493
Feeding fat into milk 493
Feeding value of distillery pulp for milch cows, N. Hansson 493

DAIRY FARMING—DAIRYING.

Page
Dairy herd record, W. J. Elliott 494
Discussion of milk problem from standpoint of production, C. E. Marshall ... 494
Scheme for sanitary control of municipal milk supply, G. W. Goler 494
A study of the milk supply in New York, S. W. S. Toms 494
The composition and analysis of milk, H. D. Richmond 495
Analysis of samples of milk referred to government laboratory, T. E. Thorpe. 495
The morphology of milk and colostrum secretion, J. Arnold 495
Investigations of market milk in Leipsic, H. Brüning 496
Associative action of bacteria in the souring of milk, C. E. Marshall 496
A popular review of Special Bulletin No. 33, C. E. Marshall 496
Bacteria of pasteurized and unpasteurized milk, L. A. Rogers 496
The efficiency of commercial pasteurization, S. C. Prescott 497
Raw milk as a food for infants, M. Hohlfeld 497
Some creamery problems, E. H. Farrington 497
Variability of the constants of Holland butter, E. C. H. A. M. Bemelmans... 498
Some experimental results concerning the butter-making process, J. Siedel... 498
A Swiss cheese trouble, H. L. Russell and E. G. Hastings 498
Influence of different factors upon management of Emmenthal cheese factories. 498
Cheese experiments at Tann säter, Ringebu, Norway, 1904, O. Iversen 499
Danish creamery statistics, 1904, J. N. Dall 499
Dairy control associations in Norway, 1903–4, L. I. Funder 499
Report of Swedish butter exhibits, 1904, N. Engström 499

VETERINARY MEDICINE.

Annual meeting of Interstate Association of Live Stock Sanitary Boards 499
Extracts from annual report of principal veterinary surgeon, S. Stockman 500
Pathogenic micro-organisms, W. H. Park and Anna W. Williams 500
Pathogenic anaerobes and gangrenous suppuration, E. Rist 500
Notes on parasitology and technique, B. Galli-Valerio 500
Investigations in general pathology, O. Lubarsch and R. Ostertag 500
Immunity reactions within generic groups, L. Zupink 501
Immunization of sucking animals through the intestines, E. Bertarelli 501
Recent work on the bacteria of the group of tubercle bacilli, Kutscher 501
Tuberculosis, Lottermoser 501
Primary tuberculosis of the mammary gland, G. D'Alessandro 501
Virulence of apparently intact mammary glands, H. Martel and G. Guérin... 502
Transmission of tuberculosis through milk and its prevention, C. W. Strange. 502
Milk from tuberculous cows, G. Moussu 502
Tuberculosis of the elbow joint in cattle, E. Wyssmann 502
A variety of zoogleic tuberculosis, J. Cagnetto 502
The vaccination of calves against tuberculosis, G. Mullie 503
Vaccination of cattle against tuberculosis, H. Vallée 503
The diagnostic value of tuberculin, S. Arloing 503
The tuberculin test for Missouri cattle 503
Parasitic bronchitis in calves, Bergeon 503
Stiffsickness, F. Hutchinson 503
Anthrax, H. Marshall 504
Immunizing of northern cattle against Texas fever, R. J. Foster 504
Preliminary note on a protozoan occurring in ticks, B. H. Ransom 504
Dipping for cattle and sheep, F. W. White 504
A note on the history of trypanosomiasis in English Sudan, A. Laveran 504
Trypanosoma dimorphon in French Guinea, Cazalbou 504
Morphological and experimental studies of *Trypanosoma paddæ*, Thiroux 504
Treatment of trypanosomiasis by arsenious acid and trypanroth, A. Laveran . 504
Infectious anemia of horses, E. Thierry 504
Infectious anemia of the horse, Carré and H. Vallée 504
An epizootic inflammation of the pharynx in horses, Küthe 505
Glanders and farcy, R. S. Huidekoper 505
Glanders and farcy, E. Thierry 505
Glanders, J. S. Pollard 505
Diseases of the nasal cavity resembling glanders, N. I. Petropavlovski 505
Swine plague, Martensen 505
Notes on swine plague, Bunge 505
The control of swine plague, Lothes 505

Page
Some diseases of poultry, Hüneberg 506
Diseases and parasites of poultry, F. C. Elford 506

RURAL ENGINEERING.

The science of irrigation, C. S. Monerieff 506
Irrigation and drainage investigations in Montana, J. S. Baker 506
Report of progress of stream measurements for the calendar year 1904 506
Movable dam and lock 507
Compound centrifugal pumps, W. Frecheville 507
The value of windmills in India, A. Chatterton 507

RURAL ECONOMICS.

Some aspects of the organization of French agriculture, W. G. A. 509
The economics of land tenure in Georgia, E. M. Banks 509
Water rights on interstate streams, R. P. Teele and E. Mead 510
Crop Reporter 511
Measures for the advancement of agriculture in Iceland, S. Sigurdson 511

MISCELLANEOUS.

Eleventh Annual Report of Montana Station, 1904 511
Twenty-seventh Annual Report of North Carolina Station, 1904 511
Twenty-third Annual Report of Ohio Station, 1904 511
Fourteenth Annual Report of Oklahoma Station, 1905 512
Press bulletins 512
Agricultural directory for Denmark, 1905, H. C. Larsen 512
Report of the agricultural department of Norway, 1904 512
Report of the agricultural department of Sweden, 1903 512
Southern Rhodesia 512
Vademecum for the agriculturist, R. and H. Hitschmann 512

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Page.

Alabama College Station:
Bul. 132, Apr., 1905 471
Alabama Tuskegee Station:
Bul. 7, Sept., 1905 455
Arizona Station:
Bul. 51, June 30, 1905 ..... 457, 463, 466, 467, 480, 490
California Station:
Bul. 168, May, 1905 474
Colorado Station:
Bul. 101, Apr., 1905 477
Bul. 102, Aug., 1905 491
Florida Station:
Bul. 79, Apr., 1905 479
Bul. 80, Apr., 1905 489
Georgia Station:
Bul. 68, Aug., 1905 466
Hawaiian Sugar Planters' Station:
Div. Ent. Bul. 1, pts. 1–4, May–Sept., 1905 477
Maine Station:
Bul. 118, July, 1905 482
Massachusetts Station:
Met. Buls. 201–202, Sept.–Oct., 1905 440
Michigan Station:
Bul. 228, June, 1905 494
Bul. 229, June, 1905 496
Bul. 230, June, 1905 471
Spec. Bul. 33, June, 1905 496
Montana Station:
Eleventh An. Rpt., 1904 .. 440, 451, 454, 458, 463, 477, 487, 494, 506, 511
Nevada Station:
Bul. 59, June, 1905 440
New Jersey Stations:
Bul. 186, Sept. 1, 1905 477
Bul. 187, Sept. 2, 1905 450
New York Cornell Station:
Bul. 231, Aug., 1905 ..... 463, 467
Bul. 232, Aug., 1905 461
New York State Station:
Bul. 268, Sept., 1905 490
North Carolina Station:
Twenty-seventh An. Rpt., 1904 444, 480, 511

Stations in the United States—Continued.

Page.

North Dakota Station:
Bul. 66, Aug., 1905 443
Ohio Station:
Bul. 152 (Twenty-third An. Rpt., 1904), June, 1904 ..... 440, 462, 511, 512
Oklahoma Station:
Fourteenth An. Rpt., 1905 ... 441, 454, 479, 512
Rhode Island Station:
Bul. 107, June, 1905 464
Bul. 108, July, 1905 451
South Carolina Station:
Bul. 110, Apr., 1905 451
Bul. 111, Apr., 1905 451
Bul. 112, May, 1905 451
Bul. 113, May, 1905 451
Wisconsin Station:
Bul. 127, Aug., 1905 492
Bul. 128, Sept., 1905 498
Bul. 129, Sept., 1905 497

U. S. Department of Agriculture.

Bureau of Animal Industry:
Bul. 73 (5 cents) 496
Circ. 75 493
Circ. 76 504
Circ. 77 490
Circ. 78 505
Bureau of Biological Survey:
Bul. 21 (5 cents) 476
Bul. 22 (5 cents) 476
Bureau of Chemistry:
Bul. 93 (10 cents) 458
Bul. 94 (10 cents) 465
Bul. 95 (5 cents) 457
Bureau of Statistics:
Bul. 34 (5 cents) 456
Crop Reporter, vol. 7, Nos. 3–6, July–Oct., 1905 511
Office of Experiment Stations:
Bul. 156 (5 cents) 481
Bul. 157 (10 cents) 510

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D.
Rural Engineering—R. P. Teele.
Rural Economics—H. C. Taylor, Ph. D.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 6.

Editorial notes: Page.
Secondary agricultural instruction in California 521
An Institute of Animal Nutrition 523
Recent work in agricultural science 525
Notes 606

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Formation of ammonia from the elements, F. Haber and G. van Oordt 525
The direct synthesis of ammonia, E. P. Perman 525
Formation of ammonia from the elements, F. Haber and G. van Oordt 526
Action of nitrogen on water vapor at high temperatures, O. F. Tower 526
The action of nitrogen on water vapor, O. F. Tower 526
Nitric acid from air, H. R. Carveth and C. L. Rand 526
Oxidation of nitrogen of air by electrical discharges, F. von Lepel 526
Oxidation of atmospheric nitrogen in high tension arc, A. Stavenhagen 527
Examination of cyanamid and applications of the method, R. Perotti 527
Expulsion of ammonium salts after precipitation in their presence, P. Jannasch. 527
The true atomic weight of nitrogen, G. D. Hinrichs 527
A revision of the atomic weight of potassium, E. H. Archibald 527
Determination of assimilable phosphoric acid in soils, A. S. Kudashev 527
Action of phosphates on platinum in presence of carbon, W. P. Headden 527
The determination of aluminum in ash of plants, H. Pellet and C. Fribourg .. 527
A method for the determination of carbonates in soils, A. Amos 528
Contribution to chemical methods of water examination, A. Bömer 528
Some points about water analysis, C. D. Howard 528
Modification of Winkler's method of determining oxygen in water, H. Noll .. 528
Report of international committee for analysis of fertilizers, etc., T. B. Wood. 528
Analysis of feeding stuffs and relation to feeding experiments, V. Storch 528
Methods of estimating fat, G. Rosenfeld 529

Page.

Determination of fat and water in butter by the Gerber method, A. Hesse.... 529
Tests of Sichler's "sin-acid" butyrometry, Lotterhos 529
Determination of fat content of butter by method of Gottlieb, A. Burr 529
On the examination of curdled milk, von Wissell 529
Contribution to the knowledge of sesame oil, H. Sprinkmeyer and H. Wagner. 529
The guaiac reaction of milk, A. Arnost 529
Contribution to the study of starch sirups, von Raumer 529
New indirect method of determining aldehyde in lemon oil, E. Berté 530
The estimation of the fusel oil of alcoholic liquors, E. Beckmann 530
Action of pepsin and its quantitative estimation, P. W. Cobb 530
The estimation of boric acid, W. Vaubel and E. Bartelt 530
Modification of Hehner's test for formaldehyde, A. B. Lyons 530
Analysis of tanning materials, S. R. Trotman and J. E. Hackford 530
Use of electric current in food analysis, G. Rupp 530
Outlines of physiological chemistry, S. P. Beebee and B. H. Buxton 531
Agricultural experiment stations in continental Europe, H. G. Söderbaum ... 531

METEOROLOGY—WATER.

Report of Interstate Astronomical and Meteorological Conference, Adelaide .. 531
Report on climate and weather of Baltimore and vicinity, O. L. Fassig 531
Meteorology [of Tunis], winter of 1904–5, G. Ginestous 531
On the cyclonic distribution of rainfall, J. A. Udden 531
Influence of eclipses on movement of atmosphere, Fonvielle and Bordé 532
The pioneer forecasters of hurricanes, W. M. Drum 532
Lunar influences, C. Flammarion 532
Influence of climatic factors on development of plants, V. Ivanov 532
Chemical composition of atmospheric precipitation, A. Posnjakow 532
Amounts of nitrogen and chlorin in rain water at Rothamsted, N. H. J. Miller. 533
Nitrous acid in sea water, E. Bödtker 533
Neolithic dew-ponds and cattle-ways, A. J. and G. Hubbard 533
Recent progress in matters of water supply and sewage disposal, G. W. Fuller. 533
Purification of waste waters of towns and of industries, A. Calmette et al 533

SOILS—FERTILIZERS.

Four years' soil investigation in Illinois wheat belt, C. G. Hopkins et al 534
Four years' soil investigation in Illinois corn belt, C. G. Hopkins et al 534
Water content of soil and requirements of plants, C. von Seelhorst and Müther. 534
The hydroscopic capacity of soils, C. M. Luxmoore 534
Moisture of the soil in the climate of Tunis, F. Bœuf and Tourniéroux 535
Oxidation in soils, and its connection with fertility, E. J. Russell 536
Fixation of ammoniacal nitrogen by zeolites in soil, T. Pfeiffer and A. Einecke. 536
Determination of ammonia absorption by soils, Wohltmann and P. Schneider. 537
The direct solution of the silicates of the soil, L. Cayeux 537
Agricultural charts, J. Graftiau 537
Soil fertility, J. B. Dandeno 537
The microscopic world and agriculture, L. Grandeau 537
Suggestions concerning legume inoculation, L. T. Clark 537
Experiments on the action of lime nitrogen, E. Haselhoff 537
Effect of ammonium salts on assimilation of phosphoric acid, Prianishnikov .. 538
Nitrate of soda as a fertilizer, M. Weitz 538
Experiments with Lützeler meat guano, E. Haselhoff 538
Value of Thomas slag and steamed bone meal with kainit, E. Haselhoff 539
Experiments on Thomas slag rich in silicic acid, E. Haselhoff 539
Experiments with steamed Thomas slag, E. Haselhoff 539
Potash salts, M. Maercker and M. Hoffmann 539
On liming, O. Loew 539
Fertilizer suggestions, E. R. Flint 539
Commercial fertilizers and chemicals, T. G. Hudson et al 539
Fertilizer analyses, A. J. Patten 539

AGRICULTURAL BOTANY.

Effects of mutilation, or cutting, on growth, G. E. Stone 540
The effect of light and Bordeaux mixture on plants, R. Ewert 540
The action of ether and chloroform on dry seeds, P. Becquerel 541

Page.
Transformation of nitrogenous material during ripening of seeds, G. André... 541
The reserve carbohydrates of evergreen trees, Leclerc du Sablon... 541
The proteases of plants, II, S. H. Vines... 542
The biology of *Melanpyrum pratense*, L. Gautier... 542
The best cells of the hypocotyl of flax, A. Herzog... 542
How to know wild fruits, Maude G. Peterson... 542
Evolution of cellular structures, O. F. Cook and W. T. Swingle... 542

FIELD CROPS.

The book of the Rothamsted experiments, A. D. Hall... 542
The Woburn field experiments, 1903, J. A. Voelcker... 543
The Woburn pot-culture experiments, 1903, J. A. Voelcker... 544
[Work with field crops], J. S. Cole... 544
Experiments by the agricultural winter school at Frankenthal, V. Renner... 544
Report of Wisconsin Agricultural Experiment Association, R. A. Moore... 544
Agriculture in the North Central States, G. Stieger... 545
Agriculture without irrigation in the Sahara Desert, T. H. Kearney... 545
The ripening of grain, A. Nowacki... 545
Grass lands of the south Alaska coast, C. V. Piper... 546
Contribution to the knowledge of Argentinian grasses, T. Stuckert... 546
The seeds of the blue grasses, E. Brown and F. H. Hillman... 546
Yellow oat grass, D. Finlayson... 546
Tall oat grass, D. Finlayson... 546
Meadow fescue, D. Finlayson... 547
Report on the manuring of seeds hay, 1904, W. Allan... 547
Composition of forage crops, S. Tretyakov... 547
Trifolium incarnatum, D. Finlayson... 547
Adulteration of alfalfa and red clover seed, J. Wilson... 547
Experiments with fodder beets in 1903–4, Tourniéroux... 547
Corn growing in Virginia, A. M. Soule... 548
The production of good seed corn, C. P. Hartley... 548
Pedigreed seed corn, C. G. Williams... 548
Score card for dent corn... 548
Cultivation of cotton on the Odessa Experiment Field, Rotmistrov... 548
Fertilizer experiments with hops near Saaz, A. Mahner... 548
The peanut and its culture, W. N. Roper... 548
Injurious effect of crude potash salts on the potato, H. Süchting... 548
Influence of environment on composition of the sugar beet, H. W. Wiley... 549
Culture of sugar cane and sugar industry in Hawaii and Réunion, L. Colson... 551
Assimilation in the sugar cane plant, Z. Kamerling... 551
Tobacco investigations in Ohio, G. T. McNess and G. B. Massey... 551
Experiments in growing Sumatra tobacco under shelter tent, 1903, W. Frear... 552
Tobacco investigations in Porto Rico during 1903–4, J. van Leenhoff, jr... 552
Improving the quality of wheat, T. L. Lyon... 552
Variability of wheat varieties in resistance to toxic salts, L. L. Harter... 553
Cultivation of wheat at the Bathurst Farm, R. W. Peacock... 555
Cultivation of wheat at Glen Innes Experimental Farm, R. H. Gennys... 555
Position of wheat grains, J. Adorján... 555
Quality of seed in its relation to the yield of wheat, J. Adorján... 555
Variety tests with winter rape, T. Remy... 555
A common error in germination tests... 555
The vitality of buried seeds, J. W. T. Duvel... 556
Destruction of wild mustard, J. B. Martin... 556

HORTICULTURE.

Tomatoes under glass. Methods of pruning tomatoes, G. E. Stone... 556
Principles of mushroom growing and mushroom spawn making, B. M. Duggar... 557
Pure culture mushroom spawn, F. Canning... 558
Edible and poisonous mushrooms, G. McCarthy... 558
American fruit industry and development of exports, P. J. Schlösser... 558
General considerations in regard to pruning, G. E. Stone... 558
Winter injury to fruit trees, H. J. Eustace... 558
Apples of New York, I, S. A. Beach, N. O. Booth, and O. M. Taylor... 559
Report of Woburn Experimental Farm, Duke of Bedford and S. U. Pickering... 559

Page.

The ripening of peaches, W. D. Bigelow and H. C. Gore 561
Studies on peaches, W. D. Bigelow and H. C. Gore 561
Plums for home and market, W. J. Green and F. H. Ballou 562
Hybrids in their relation to grafting and wine, L. Daniel 562
Analyses of American grape shoots, J. Gáspár 562
The passion fruit, W. J. Allen 562
Notes on the growth and culture of vanilla, J. Constantin 562
Vanilla culture in the Hawaiian Islands, A. Inkersley 563
A revised classification of roses, 1905, J. G. Baker 563
Our native orchids, W. H. Gibson and Helena L. Jelliffe 563
Ether forcing without a greenhouse, Flora L. Marble 563
Two examples of grafts, L. Daniel 563

FORESTRY.

Forest irrigation experiments, K. Böhmerle 563
Forest irrigation experiments, A. Cieslar 564
The dead cover of forests and nitrogen, Hornberger 564
Observations on the preceding memoir, E. Henry 564
All the spruces worth cultivating, J. F. Johnston 565
Productivity of Siberian larch, Guse 565
Mallet eucalypt bark better than black wattle, D. E. Hutchins 565
Analysis of mallet bark 565
Hedgerow timber, A. C. Forbes 565
Forest planting and farm management, G. L. Clothier 565
New source of rubber 565
Rubber planting industry in Ceylon 565
Rubber in Hawaii, J. G. Smith 566
Results of tapping experiments in a Kickxia plantation, O. Warburg 566
Estimate of cultivated rubber in the world 566

DISEASES OF PLANTS.

Notes on parasitic diseases of plants, F. Bœuf 566
Diseases of plants in the Tropics, G. Delacroix 566
A blight of barley and oats 566
Preliminary note on clover diseases in Tennessee, S. M. Bain and S. H. Essary 567
Diseases of tobacco, M. T. Cook and W. T. Horne 567
Duration of Gymnosporangium and its relation to rusts, E. Prillieux 567
The black spot, or scab, of the apple and pear, C. P. Lounsbury 567
Fire blight, L. F. Henderson 568
Black and gray rot in Indre, H. Blin 568
Treatment for Botrytis of grapes, L. Degrully 568
The rougeot of grape, L. Ravaz and L. Roos 568
Acariosis, brunissure, and erinosis, H. Faes 569
A disease of cherry laurel, E. Raignault 569
Report of the botanist, J. Burtt-Davy 569
Notes on the use of combined fungicides, L. Augrand 569
A study of combined fungicides, J. de Bouttes 570
The crystallization of soda fungicides, F. Porchet 570

ECONOMIC ZOOLOGY—ENTOMOLOGY.

The mammals of Great Britain and Ireland, J. G. Millais 570
Game laws for 1905, T. S. Palmer, H. Oldys, and R. W. Williams, jr 570
Destruction of gophers, ground squirrels, and prairie dogs, A. Meraz 570
The destruction of rats, G. Gandada and C. Macias 570
The destruction of field mice, H. Sagnier 571
The study of birds, C. J. Pennock 571
The value of birds to the farmer, T. G. Pearson 571
Birds from certain of the Philippine Islands, R. C. McGregor 571
The horned larks and their relation to agriculture, W. L. McAtee 571
An apparatus for collecting small arthropods, A. Berlese 572
Index-catalogue of medical and veterinary zoology, C. W. Stiles and A. Hassall 572
Insects injurious to grain and fodder crops, etc., J. Fletcher 572
Insects of Herm and Jethou, W. A. Luff 572

Page.
The insect galls of Indiana, M. T. Cook 572
The cotton-boll weevil, P. Marchal 572
The cotton caterpillar 572
Combating the cotton-boll weevil and cotton caterpillar, A. L. Herrera 572
The early history of the Hessian fly in America, F. M. Webster 573
Locust destruction, W. H. Bushby 573
The destruction of white grubs in the district of Meaux, J. Bénard 573
The habits and metamorphosis of *Lebia scapularis*, F. Silvestri 573
Invasion of bark beetles in Vosges, Rivet 573
Note upon the "bee-hole" borer of teak in Burma, E. P. Stebbing 573
Hazelnut disease and means of combating it, A. Trotter 573
The vaporer moth, W. Forbes 573
The gypsy moth, A. E. Stene 574
Mites in rubber nurseries, S. Arden 574
The red disease of the grapevine and its treatment, E. Zacharewicz 574
Report of the American Mosquito Extermination Society, H. C. Weeks 574
Lantern traps for noxious micro-lepidoptera, A. L. Herrera 574
Nursery fumigation, C. Fuller 574
Experiments with fumigating nursery stock, T. B. Symons and A. B. Gahan 574
Orchard fumigation with hydrocyanic-acid gas, C. Fuller 575
Spray calendar 575
Bee culture, J. S. Gilfillan 575
Sericulture in Madagascar, E. Prudhomme 575
Diseases of the silkworm and means of combating them, G. Gandara 575

FOODS—HUMAN NUTRITION.

Food adulteration in Arkansas, J. H. Norton 575
Report of the State food commissioner of Illinois, A. H. Jones 575
Analyses of food products, W. W. P. McConnell 576
Report of State chemist, J. Hortvet 576
Report of deputy food commissioner, W. F. Thompson and E. L. Redfern 576
Report of the Ohio dairy and food commissioner, H. Ankeney 576
The food inspector's handbook, F. Vacher 576
The sanitary inspector's handbook, A. Taylor 576
Municipal food control manual, H. Messner 576
Existing official [food] laboratories, A. C. Girard 576
The detection of corn meal in sausage, H. Kreis 576
Analyses of Messina and New South Wales lemons, F. B. Guthrie 577
Properties and composition of some typical flours, W. E. Matthewson 577
Chemical composition and nutritive value of wheat and flour, Chapus 577
The condition of starch in stale bread, E. Roux 577
Poisonous bread, A. Yachevski 577
Some causes of discoloration of canned mushrooms, J. Sarthou 577
Concerning certain adulterations of lard, A. Olig and J. Tillmans 577
The quality of commercial cream of tartar, L. D. Havenhill 577
Examining and judging ground black peppers, E. Spaeth 578
Concerning the analysis of wine vinegar, A. Froehner 578
Standards of purity for fermented and distilled liquors, P. Schidrowitz 578
Sterilized fruits 578
Dietetic use of predigested legume flour, D. L. Edsall and C. W. Miller 578
The diet in typhoid fever, J. B. Nichols 578
The use of copper in destroying typhoid organisms, H. Kraemer 578
Diet in health and disease, J. Friedenwald and J. Ruhräh 579
Nutrition and malnutrition, W. H. Allchin 579
Standardized gruels, H. D. Chapin 579
Influence of organic phosphorus on nutrition, A. Desgrez and A. Zaky 579
Peptic cleavage products of a proteid of wheat gluten, Hayashi 579
Course of wholesale prices, 1890 to 1904 579

ANIMAL PRODUCTION.

Energy values of clover hay and maize meal, H. P. Armsby and J. A. Fries 579
Weathered hay, W. F. Sutherst 581
Digestion coefficients of alfalfa, H. G. Knight 581
Condimental stock and poultry foods, J. B. Lindsey et al 581
Analysis of commercial feeding stuffs, H. B. McDonnell et al 583

Page.
The nutritive value of dried grape pomace, S. Weiser 583
Phosphate of lime in the feeding of farm animals, J. P. Wagner 583
Methods of beef production, III, IV, and VI, H. W. Mumford and L. D. Hall. 583, 584
Flaxseed for fattening lambs, G. E. Morton 585
Bacon pigs in Canada, J. H. Grisdale 585
Effect of movement upon digestion and absorption of nutrients, A. Scheunert. 585
The daily ration of work horses, L. Grandeau 586
Examination of horses for soundness, G. H. Roberts, edited by A. M. Bitting. 586

DAIRY FARMING—DAIRYING.

Distillers' dried grains v. cottonseed meal, H. P. Armsby and A. K. Risser 586
Report of experiment station at Kleinhof-Tapiau, 1904–5, Hittcher 586
Possibilities of profitable cows on the farm, A. J. Glover 587
Investigations on the fat-free solids in fractional milkings, F. Lauterwald 587
Relations between method of milking and composition of milk, F. Krull 587
Sampling milk for composite tests, H. A. Hopper 587
Value of nitrate reaction for detecting adulteration with water, J. Adorján 587
Bodies in milk serum which react with β-naphthalin-sulphochlorid, R. Stritter .. 587
Variation of casein in human milk, G. Patein and L. Deval 587
Determination of dirt in milk, H. Weller 587
Infantile mortality and milk depots, W. J. Thompson 588
Action of formaldehyde in preservation of milk, F. D. Chester and T. R. Brown. 588
On abnormal butter, K. Fischer 589
On the ripening of Edam cheese, F. W. J. Boekhout and J. J. O. de Vries 589
Chemical difference between casein and paracasein, W. Laqueur 589
The principal products and by-products of milk, G. Rovesti 590
A note on the bacteriological examination of milk, G. Newman 590
Uniformity in milk culture media for bacteria, B. Czaplicki 590

VETERINARY MEDICINE.

Economic aspect of veterinary science, S. S. Cameron 590
Animal plagues and quarantine laws, Profé 590
Legislation needed for the protection of Missouri live stock, D. F. Luckey 590
Importance of milk and meat inspection to the public health, T. J. Sullivan .. 591
Hygiene of domestic animals, N. S. Mayo 591
Stall disinfection by means of formaldehyde and steam, Perkuhn 591
Report of the veterinary bacteriologist, A. Theiler 591
Report on work of veterinary department, S. Stockman 591
Conference on bovine tuberculosis, S. Arloing 592
Anthrax, H. A. Ballou et al 592
Preventive inoculation for redwater, J. A. Robinson 592
Texas fever, W. H. Dalrymple 592
Anaerobic bacteria as cause of necrosis and suppuration in cattle, L. Roux 592
Pneumo-enteritis in calves, A. W. Curlewis 593
Influence of cold on the virus of foot-and-mouth disease, E. Perroncito 593
Spraying v. dipping, A. W. Douglass and L. J. Roberts 593
Sheep dipping 593
Vaccination for sheep pox and blackleg, Soulié 593
Indefinite preservation of virus of sheep pox in leeches, F. J. and E. Bosc 593
Prevention and cure of foot rot in sheep 594
Simple rules for judging reactions of tuberculin and mallein, O. Malm 594
Experiments on two horses from a stud infected with glanders, A. E. Mettam. 594
Glanders of horses, R. R. Dinwiddie 594
A case of uveitis malleotica, J. de Haan 595
Action of certain oxidizing substances upon the toxin of tetanus, C. Paderi ... 595
Studies and observations on rabies, E. Barterelli 595
Rabies in Muridæ, C. Franca 595
Treatment of rabies with radium, G. Tizzoni and A. Bongiovanni 595
Fowl plague in geese, F. K. Kleine and B. Möllers 596
Trichina and trichinosis, N. I. Petropavlovski 596
Parasites in cattle and poultry in Trinidad, C. W. Meaden 596
Nodular disease of the intestines of cattle and sheep, L. Scheben 596
Veterinary department, E. L. Moore 596
Stomach worms, A. A. Brown 596

RURAL ENGINEERING.

Page.
Work of the Office of Experiment Stations in irrigation and drainage 597
Irrigation in the western United States, R. A. van Sandick 597
The East Canyon Creek Reservoir, Morgan County, Utah, W. M. Bostaph ... 597
Irrigation furrow plow 597
Underground waters of Salt River Valley, Arizona, W. T. Lee 597
Report on the establishment of tide-gauge work in Louisiana, G. D. Harris ... 598
Study of rock decomposition under the action of water, A. S. Cushman 598
Manual for Iowa highway officers, A. Marston et al 598
Road improvement in South Carolina, P. T. Brodie 599
Petrol, paraffin, or alcohol for agricultural motors, D. Albone 599
Modern refrigerating machinery, H. Lorenz, trans. by T. H. Pope 599

RURAL ECONOMICS.

Contributions to the economics of agriculture, F. Aereboe 599
Agricultural explorations in Algeria, T. H. Kearney and T. H. Means 600
Development of demand for agricultural labor in East Prussia, F. Wegener ... 600
Agricultural laborers in the district of Melun, H. Hitier 600
Laborers' holdings in Denmark 600
Agriculturists and breeders, L. Léouzon 601
Trade with noncontiguous possessions in farm and forest products 601
Imports of farm and forest products, 1902–1904 601
Exports of farm and forest products, 1902–1904 601
Crop export movement and port facilities, F. Andrews 602
Agricultural statistics of Ireland for 1904 602
Report on agricultural and pastoral statistics [of Queensland] for 1904 602

AGRICULTURAL EDUCATION.

First principles of agriculture for the primary schools of Bolivia 602
Horticultural education, F. A. Waugh 603
Agriculture in the schools, F. H. Hall 603
Nature study, F. Overton and Mary E. Hill 603
Nature teaching, F. Watts and W. G. Freeman 603
Nature study, W. N. Hutt 603
A nature study of Maryland plants, F. H. Blodgett 603
Report on school gardens and native plants for the year 1904, H. S. Adams ... 603
School gardens for California schools, B. M. Davis 604
A new kind of garden school, Mary L. Butler 604
Domestic science courses in the high school, Ellen H. Richards 604
Housekeeping schools for farmers' daughters, J. I. Brittain 604

MISCELLANEOUS.

Eighteenth Annual Report of Arkansas Station, 1905 604
Twelfth Annual Report of Minnesota Station, 1904 604
Annual Report of South Dakota Station, 1905 605
Accessions to the Department Library, April–September, 1905 605

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Arkansas Station: Page.
Bul. 87, 1905 594
Bul. 88, 1905 575
Eighteenth An. Rpt., 1905 ... 604
Delaware Station:
Bul. 71, Aug., 1905 588
Florida Station:
Bul. 81, Aug., 1905 539
Illinois Station:
Circ. 90, April, 1905 587
Circ. 91, April, 1905 583
Circ. 92, May, 1905 584
Circ. 98, Sept., 1905 584
Circ. 99, Oct., 1905 534
Circ. 100, Oct., 1905 534
Indiana Station:
Bul. 109, Nov., 1905 586
Louisiana Stations:
Bul. 84 (second series), Oct., 1905 592
Geol. Survey Bul. 3, 1905 598
Maryland Station:
Bul. 105, Aug., 1905 574
Massachusetts Station:
Bul. 105, Aug., 1905 ... 540, 556, 558
Bul. 106, Sept., 1905 581
Michigan Station:
Bul. 231, June, 1905 537
Bul. 232, July, 1905 539
Minnesota Station:
Twelfth An. Rpt., 1904 604
New York State Station:
Bul. 269, Oct., 1905 558
Twenty-second An. Rpt., 1903, pt. 2 559
Ohio Station:
Bul. 162, May, 1905 562
Circ. 42, Sept. 14, 1905 548
Circ. 43, Oct. 10, 1905 548
Pennsylvania Station:
Bul. 72, July, 1905 552
Bul. 73, Sept., 1905 586

Stations in the United States—Continued.

Porto Rico Station: Page.
Bul. 5 (Span. ed.), 1905 (5 cents) 552
South Dakota Station:
An. Rpt., 1905 ..... 544, 596, 605

U. S. Department of Agriculture.

Circ. 14 547
Farmers' Bul. 228 565
Farmers' Bul. 229 548
Farmers' Bul. 230 570
Bureau of Animal Industry:
Bul. 39, pt. 12 (5 cents) 572
Bul. 39, pt. 13 (5 cents) 572
Bul. 74 (5 cents) 579
Bureau of Biological Survey:
Bul. 23 (5 cents) 571
Bureau of Chemistry:
Bul. 96 (5 cents) 549
Bul. 97 (5 cents) 561
Bureau of Plant Industry:
Bul. 78 (10 cents) 552
Bul. 79 (5 cents) 553
Bul. 80 (10 cents) 600
Bul. 81 (5 cents) 542
Bul. 82 (10 cents) 546
Bul. 83 (5 cents) 556
Bul. 84 (5 cents) 546
Bul. 85 (10 cents) 557
Bul. 86 (5 cents) 545
Bureau of Soils:
Bul. 29 (5 cents) 551
Bureau of Statistics:
Bul. 35 (5 cents) 601
Bul. 36 (10 cents) 601
Bul. 37 (10 cents) 601
Bul. 38 (5 cents) 602
Office of Experiment Stations:
Circ. 63 597
Office of Public Roads:
Circ. 38 598
Library:
Bul. 56 (5 cents) 605
Bul. 57 (5 cents) 605

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

ILLUSTRATION.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D
Rural Engineering—R. P. Teele.
Rural Economics—H. C. Taylor, Ph. D.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 7.

Editorial notes:	Page.
Government aid to agriculture in India	625
Development of agricultural experimentation and instruction in India	627
New horticultural building at the Massachusetts Agricultural College	630
Recent work in agricultural science	633
Notes	717

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Agricultural chemistry during the first half of the year 1905, W. Zielstorff	633
Formation of oceanic salt deposits, J. H. van't Hoff and W. C. Blasdale	633
Comparative study of methods of analysis in different countries, L. Sicard	633
Determination of black alkali in waters and soil extracts, W. W. Skinner	633
Determination of strength of solutions used in nitrogen determination, F. Mach	634
Determination of organic nitrogen in sewage by Kjeldahl process, E. B. Phelps	634
Determination of nitric and nitrous acids, J. Meisenheimer and F. Heim	634
The determination of nitrous acid, F. Raschig	634
Determination of nitric and nitrous acids, J. Meisenheimer and F. Heim	635
German official method of estimating nitric acid in meat, K. Farnsteiner	635
The quantitative estimation of nitric acid in meat, W. Stüber	635
Judging meat extracts, M. Siegfried and E. Singewald	635
Proteins of the castor bean, T. B. Osborne, L. B. Mendel, and I. F. Harris	635
Studies of the nature of strawberry fat, J. Aparin	635
The behavior of lecithin to ferments, P. Mayer	635
The curcuma reaction for boric acid, A. Goske	636
The qualitative detection of boric acid, O. Mezger	636
Quantitative estimation of vanillin, J. Hanuš	636
Paints and paint products, E. F. Ladd and C. D. Holley	636

METEOROLOGY—WATER.

	Page.
Monthly Weather Review, Vol. XXXIII, Nos. 6–9	636
Meteorological observations, J. E. Ostrander and C. H. Chadwick	637
Meteorological summary for 1904, C. A. Patton	638
Report of the section of climatology of the National Irrigation Congress	638
Report of Eighth International Geographic Congress, 1904	638
Precipitation and storms in Grand Duchy Saxe-Altenburg, 1900–1904, F. Kr[illegible]ger	639
Influence of water vapor upon nocturnal radiation, J. R. Sutton	639
Contributions to hydrology of eastern United States, 1905, M. L. Fuller	639
Underground waters of Mississippi, W. N. Logan and W. R. Perkins	640
Subartesian water supply, W. G. Cox	640
Field measurements of rate of movement of underground waters, C. S. Slichter	641
Destructive floods in the United States in 1904, E. C. Murphy et al	641
Normal distribution of chlorin in natural waters, D. D. Jackson	641
Mineral waters of the United States, J. K. Haywood and B. H. Smith	641
Purifying drinking water by electricity, R. Guenther	642
Copper sulphate for killing green scums, S. Avery and A. Keyser	642
Estimation of *Bacillus coli* in potable waters, A. Gautié	642

SOILS—FERTILIZERS.

Alkali conditions in the Payette Valley, J. S. Burd	643
The geological survey of Ireland, G. A. J. Cole	643
The soils of Montserrat, F. Watts and H. A. Tempany	644
Illustration of wire-basket method for soil testing, F. D. Gardner	644
The absorptive power of soils, C. Dusserre	644
Absorptive properties of decomposed rocks, M. Dittrich	644
Insoluble alkali compounds originating in humus substances of soil, Berthelot	644
Peat and its products, W. A. Kerr	645
Manurial requirements of Cecil silt loam, F. D. Gardner and F. E. Bonsteel	646
Manurial requirements of sandy loam, F. D. Gardner and F. E. Bonsteel	646
Liming soils	647
Action of water-soluble mineral constituents of plant residues, S. Krawkow	647
Tubercle-forming bacteria of legumes, L. L. Lewis, J. F. Nicholson, et al	647
Soil inoculation, L. L. Lewis, J. F. Nicholson, et al	648
Quality of commercial cultures for legumes, H. A. Harding and M. J. Prucha	648
Commercial cultures for legumes not reliable, F. H. Hall et al	648
Soil bacteria, A. A. Brown	648
The micro-organisms of the soil, M. E. Kayser	648
The nitrogen feeding of agricultural plants, Wein	648
Loss of nitrogen in liquid manure and its prevention, H. Björn-Andersen	649
Nitrates and nitrites as fertilizers, T. Schloesing, jr	649
On the use of leucite as a fertilizer, E. Monaco	649
Experiments with Thomas-ammonium-phosphate lime, E. Haselhoff	649
Comparative tests of Thomas slag and agricultural phosphate, Kuhnert	649
Sources and manufacture of phosphates and potash salts, E. B. Voorhees	650
Experiments with various potash fertilizers, E. Haselhoff	650
The availability of mixed fertilizers, W. F. Sutherst	650
Inspection and analyses of commercial fertilizers, W. F. Hand et al	651

AGRICULTURAL BOTANY.

Sensitiveness of the chlorophyll of plants, W. Lubimenko	651
Influence of sunlight and diffused light upon leaf development, J. Wiesner	651
Regeneration in roots, B. Němec	651
Absorptive capacity of roots in the light and in the dark, E. Pantanelli	652
Study of injury to plants by fumes from industrial works, P. Sorauer	652
Endurance of crops for injurious substances, F. B. Guthrie and R. Helms	652
Albinism in the plant kingdom, E. Pantanelli	653
The effect of low temperatures on moist seeds, J. Adams	653
The action of liquid air on the life of seeds, P. Becquerel	653

FIELD CROPS.

Cooperative fertilizer experiments, 1904, P. Bolin	654
Report of the government agrostologist and botanist, J. Burtt-Davy	655

Page.
The effect of press drilling on grain crops in 1904–5, Falke 655
Farm grasses of the United States, W. J. Spillman 655
The cause of growth in barley, W. Windisch and K. Schönewald 655
Breeding experiments with barley, T. Ramie 656
Influence of chemical composition of seed on barley, J. Vañha et al 656
Varieties of barley, E. S. Beaven 657
Experiments with corn, T. L. Lyon 657
Influence of size of grain and germ of corn upon the plant, E. P. Walls 658
American cotton supply and its distribution, S. N. D. North et al 658
Distribution of cotton seed in 1904, H. J. Webber and A. J. Pieters 659
Thirty-seventh annual report of the Flax Supply Association 659
Information concerning flax grown on the Russian steppes, A. Herzog 659
Sets and their position as influencing yield of potatoes, A. Andouard 659
The new potato, G. Bonnier 659
Rye and some of its uses, J. M. Jamison 659
Beet-sugar industry in the United States, P. de Vilmorin 660
Sugar cane, F. S. Earle 660
A new variety of spelt, P. H. Stoll 660
[Bibliography on tobacco] 660
Spring vetch and winter vetch, E. Rabaté 660
Experiments with winter wheat, C. G. Williams 660
Annual report of the seed control station at Örebro, 1904, J. Widén 661

HORTICULTURE.

Report of fruit stations of Ontario, 1904, L. Woolverton et al 661
British fruit growing, S. Pickering 661
British fruit growing, A. O. Walker 662
Fruit culture in Argentina, C. P. Lounsbury 662
The fruit industry at Barbados, J. R. Bovell 662
Influence of the scion on stock, A. Julie 662
Sod-grown fruit, H. M. Stringfellow 662
Stringfellow tree culture, J. C. Whitten 662
Cause of abnormal quantities of starch in bruised apples, G. Warcollier 663
The packing of peaches, F. Charmeux 663
How fruit should be packed 663
Cold storage for fruits and vegetables, R. Stetefeld 663
Causes of citrus fruit decay, G. H. Powell 663
The newer strawberries, W. J. Green and F. H. Ballou 664
Strawberry culture in Cuba, H. J. Squiers 664
Small fruits, J. F. Nicholson 664
Small fruits and grapes, C. A. Keffer 665
Layering grafted vines; grafting cuttings by approach, F. Charmeux 665
The packing of hothouse grapes, F. Charmeux 665
Proceedings of the Society for Horticultural Science 665
Okra: Its culture and uses, W. R. Beattie 665
Hop sprouts as vegetables, G. W. Roosevelt 665
Pickles—how to make them, R. Blanche Maddock 665
Ginseng in China, F. D. Cloud 665
Culture of mushroom spawn from spores, J. Steinert 665
Suggestions about seed growing, J. Jeannin, jr 666
Culture and distillation of perfumery plants in Java, P. Serre 666
Tea culture in Japan, Phipps 666
Cultivation of tea in the Caucasus, P. Stevens 666
Yerba-mate culture in New Germany, Paraguay, R. von Fischer 666
Chart of flowering trees and shrubs, F. Duncan 666
Tree subirrigation along streets and parks, C. Erwien 666
The book of garden furniture, C. Thonger 666
The book of the carnation, R. P. Brotherston 666
Grafting the carnation on Saponaria, G. Poirault 666
All the species of phlox worth cultivating, L. Barron 667
The incomparable Japanese lilies, W. Miller 667
A planting chart of bulbs and perennials, R. Cameron 667
Experimental researches on the seed of orchids, A. Maumené 667
Hybridization of Odontoglossum, L. Duval 667

FORESTRY.

Page.
Influence of origin of seed on character of forest growth, A. Engler 667
Working plan for forest lands in Berkeley County, S. C., C. S. Chapman 668
Reafforestation in the Deccan and other dry districts, H. F. Arbuthnot 668
The seasons and growth, Heck 668
Annual rings of tree growth, E. E. Bogue 669
The use of commercial fertilizers in forestry, F. Giersberg 669
Report of the conservator of forests, C. E. Legat 669
A sylvicultural study of larch, A. Cieslar 669
Treatment of Scotch pine in the vicinity of Paris, L. Pardé 669
Note on the germination of teak and other seeds, R. S. Pearson 670
Girdling of miscellaneous trees in sal forests, F. F. R. Channer 670
Some facts about gutta-percha, A. M. B. Murdock 670
Coagulation of the latex of *Ficus elastica*, E. S. Carr 670

DISEASES OF PLANTS.

Report of committee for plant protection, 1904, P. Sorauer et al 670
Disease resistance of potatoes, L. R. Jones 670
Club root disease of swedes and turnips, D. A. Gilchrist 671
A disease of artichokes, F. Parisot 672
Some diseases of cotton, G. Vert 672
Spraying for cucumber and melon diseases, W. A. Orton 672
Diseases of plants cultivated under glass, L. Mangin 672
Concerning the gummosis of oranges, A. L. Herrera 672
Leaf curl and plum pockets, P. Passy 673
Recognition of the principal diseases of the grape, G. Bertoni 673
Grape anthracnose, E. Zacharewicz 673
The treatment of Botrytis on grapes, P. de la Bathie 673
Treatments for the prevention of powdery mildew, M. Cercelet 673
Powdery mildew and *Uncinula spiralis*, P. Pacottet 673
The black rot, F. Vassillière 673
Invasions of black rot in 1904, J. Capus 674
The treatment of black rot, A. Prunet 674
Combined treatment for prevention of diseases of the grape, E. Zacharewicz .. 674
A new rose disease in Austria, G. Köck 674
Sulphur fungicides, J. M. Guillon 674
Adherence of copper fungicides, J. M. Guillon and G. Guirand 674
Adherence of copper fungicides, E. Chuard and F. Porchet 675

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Winter manual of practice in economic zoology, H. A. Gossard 675
Grouse and wild turkeys, and their economic value, S. D. Judd 676
A new method of destroying field mice, E. Schribaux 676
Injurious insects and other animals observed in Ireland, G. H. Carpenter 676
The study of insects, M. T. Cook 676
Insect notes 676
Entomological notes, J. Kotinsky 676
Report of the nursery inspector, A. E. Stene 676
Injurious insects, F. Corboz 677
Insects injurious to Indian corn, S. A. Forbes 677
Insects and diseases of tobacco, M. T. Cook and W. T. Horne 678
Insect pests of the carrot, P. Lesne 678
The potato moth, C. Fuller 678
Social organization and breeding habits of cotton-protecting kelep, O. F. Cook . 678
Spraying experiments for San José scale, 1905, T. B. Symons and A. B. Gahan . 678
San José scale in Mississippi, and lime-sulphur-salt wash, G. W. Herrick 679
Control of San José scale and other insect and fungus pests, J. H. Stewart 679
The San José scale, A. Maclellan 679
The San José scale and gypsy moth, E. H. Armstrong 679
The black-currant gall-mite, P. M. Thomson 679
Diaspis pentagona on the mulberry and other insect pests 680
The mango weevil in Hawaii, D. L. Van Dine 680
Two new shade tree pests, M. V. Slingerland 680
The fir Pissodes in the Vosges, M. Henry 680
The buffalo carpet beetle, J Fletcher 680

Page.
Modern beekeeping; its helps and hindrances, J. W. Blake 680
Sericulture in Italy, China, and Japan, H. P. Smith et al 680
Condition of Italian silk trade and yield of cocoons in Italy in 1904, P. Chapman . 681

FOODS—HUMAN NUTRITION.

Digest of Japanese investigations on the nutrition of man, K. Oshima 681
Nutritive value of cottage cheese, rice, peas, and bacon, H. Snyder 681
The specific qualities of some digestive ferments, K. Kiesel 682
Chinese bean oil, W. Korontschewsky and A. Zimmermann 682
The fat-cleaving ferment of the mucous membrane of the stomach, A. Fromme . 683
The extent of fat digestion in the stomach, A. Zinsser 683
Influence of copious water drinking, P. B. Hawk 683
Extractive material of muscular tissue, W. Gulewitsch and R. Krimberg 683
The hydrolysis of proteids. II, Gelatin, Z. H. Skraup 683
The hydrolysis of meat extracts, K. Micko 683
The protective power of asparagin, M. Müller 684
Value of inorganic salts in metabolism, A. Hirschler and P. von Terray 684
Measuring the body temperature through long periods, E. Oertmann 664
Principles of cookery, Anna Barrows 684
Notes on food and diet in Cuba, C. F. Langworthy 684
Studies on an ash-free diet, A. E. Taylor 684
Meals served for twenty cents at dairies, J. Tribot 684
Meals served for twenty-three cents and twenty-five cents, J. Tribot 684
Physiological value of foods at cheap restaurants in Paris, J. Tribot 684
Retail prices of food, 1890 to 1904 684
Means adopted for the preservation of foods, Halphen 684
Food inspection, C. D. Woods 685
Report of food inspection, C. D. Howard 685
Report of work in food laboratory, H. E. Barnard 685
[French] law against adulteration, Fayolle 685
Analyses of condensed milks and infants' and invalids' foods, C. B. Cochran .. 685
Corn beef containing flour, H. Matthes 685
[Sweet potato flour], T. M. Whelan 685
Rotten eggs for food 685
Judging egg noodles and similar goods, H. Lührig 685
The rancidity of fat, J. Klimont 685
Concerning damaged tea, P. Buttenberg 685
Pure food division, H. D. Gibbs 686
Judging the quality of wine vinegar, W. Fresenius 686

ANIMAL PRODUCTION.

Alfalfa for the growing and fattening of animals, I. D. Graham 686
Cocoanut meal as a food stuff 687
Molasses as a food for work animals, W. H. Dalrymple 687
The utilization of brewers' yeast 687
Destruction of feeding stuffs by micro-organisms, J. König et al 687
Cattle, sheep, and hog feeding in Europe, W. J. Kennedy 687
Sheep industry of England, Scotland, Ireland, and France, W. J. Kennedy ... 688
The score card in stock breeding, G. M. Rommel 688
Cattle feeding experiment, H. R. Smith 688
Cattle and cattle raising in Brazil, H. von Jhering 689
Highland cattle, J. Roberts 689
Ration experiments with lambs, 1904–5, G. E. Morton 689
Lamb feeding in the San Luis Valley 690
Notes on the Angora goat industry, G. F. Thompson 690
Consideration of mohair and mohair growing, G. A. Hoerle 690
Practical Angora goat raising, C. P. Bailey 690
Proceedings of the horse industry congress, J. M. de Lagorsse 690
Fattening draft horses, J. W. Coverdale 690
Hunter-horse production in Ireland, W. J. Kennedy 691
Mount Serle government camel depot, J. Desmond 691
Causes of daily variation in body weight, J. Latschenberger and S. Polansky . 691
Diurnal variation of the body temperature, S. Simpson and J. J. Galbraith .. 691
Incubation and incubators, R. H. Wood 691
The poultry industry of Petaluma, California, P. H. Lawler 692

Page.
The growth of chickens, M. Stefanowska 692
The Buff Orpington duck, D. F. Laurie 692
The guinea fowl and its use as food, C. F. Langworthy 692
The oyster. A popular summary of a scientific study, W. K. Brooks 692
Imports and exports of animals and animal products, J. Roberts 692
Farm animals in 1904 692
Live stock associations and the markets 693

DAIRY FARMING—DAIRYING.

Records of dairy cows in the United States, C. B. Lane 693
The dairy industry in New Hampshire, I. C. Weld 693
Demonstration experiments on the feeding of dairy cows 693
Report of the Brown Swiss Cattle Breeders' Association, 1904 694
Report of the Spotted Swiss Cattle Breeders' Association, 1904 694
Importance of a careful system of milking, H. P. Larsen 694
Consumption of milk in Antwerp and its suburbs, F. Smeyers and E. Weynants. 694
Is the composition of milk influenced by the food? O. Jensen 694
Lactic acid in cows' milk, O. H. Nowak 695
Preformed sulphuric acid in cows' milk, R. Steinegger and O. Allemann 695
Properties of salty bitter milk, R. Steinegger and O. Allemann 695
The viscous fermentation of milk and beer, F. C. Harrison 695
Budde process for the preservation of milk, R. T. Hewlett 695
Disappearance of formaldehyde in milk, R. H. Williams and H. C. Sherman. 696
Influence of formaldehyde upon milk, R. Steinegger 696
Influence of formaldehyde on proteids, R. Steinegger 696
Possible infection of man with *Micrococcus melitensis* by goats' milk 696
Injurious effects of sterilized milk on nutrition of infants, A. Karawja 696
Principles and practice of butter making, G. L. McKay and C. Larsen 696
Volatile fatty acids in palm oils and butter, O. Jensen 697
Marked case of late gassy fermentation in cheese, A. Peter and M. Schneebeli. 697
Influence of lactic acid on casein and paracasein, O. Laxa 697
New industrial product, R. Guenther 698
Officials, associations, and institutions connected with dairy interests 698

VETERINARY MEDICINE.

Report of Minnesota State Live Stock Sanitary Board, 1905, S. H. Ward et al.. 698
Human and bovine tuberculosis, N. Raw 698
The origin of pulmonary lesions in tuberculosis, H. Vallée 698
Intestinal origin of pulmonary tuberculosis, A. Calmette and C. Guérin 699
Danger of infection with tuberculosis, E. C. Schroeder and W. E. Cotton 699
Clinical and bacteriological diagnosis of bovine tuberculosis, J. Vennerholm.. 700
The tuberculin test for tuberculosis, D. E. Salmon 700
Vaccination against tuberculosis, Thomassen 700
The development of tubercular mammitis, G. Moussu 700
Contagious mammitis, G. Mayall 700
Abortion and sterility in cows, J. A. Gilruth 701
Hemorrhagic enteritis of cattle, Chaussé 701
Contagious conjunctivitis of cattle, F. A. Verney 701
Contagious pleuro-pneumonia, D. Hutcheon 701
Experiments with septicidin in septic pleuro-pneumonia of calves, Eberhard. 701
Epizootic lymphangitis, S. T. Amos 701
Bacillus necrophorus and its economic importance, J. R. Mohler and G. B. Morse. 702
Poisoning of cattle by molds, Bayer 702
Enzyms in cornstalks and their relation to cornstalk disease, T. M. Price 702
A recent outbreak of sheep pox, Teetz 702
Work against scabies of sheep and cattle in 1904, C. O. Goodpasture 702
Hog cholera, W. Robertson 703
Use of mallein in diagnosing glanders, L. J. Hoogkamer and J. de Haan 705
Dog distemper, Piorkowski 703
Fowl cholera, C. H. Stange 703
Animal parasites affecting domesticated animals, Desmond 703
Treatment for worms in domestic animals, D. Hutcheon 704
The tapeworms of American chickens and turkeys, B. H. Ransom 704
Contagious diseases of animals in foreign countries, J. Roberts 704
Exhibit of the Bureau of Animal Industry, J. M. Pickens and J. W. Fink 704

RURAL ENGINEERING.

	Page
Report of irrigation and drainage investigations, 1904	704
Duty of water, B. P. Fleming	706
The Winterton Irrigation Settlement	706
Mean velocity of uniform motion of water in open channels, I. P. Church	707
Proceedings of the second annual Iowa State Drainage Convention	707
Second conference of engineers of the Reclamation Service, F. H. Newell	707
Development of underground waters in California, W. C. Mendenhall	708
Observations on ground waters of Rio Grande Valley, C. S. Slichter	708
Hydrology of San Bernardino Valley, California, W. C. Mendenhall	708
Wells, M. Ringelmann	708
Windmills, M. Ringelmann	709
Experiments on steel-concrete pipes on a working scale, J. H. Quinton	709
Cement mortar and concrete, P. L. Wormeley, jr	709
Trap rocks as road material, C. N. Little and W. G. Turley	709
Good roads problem in Iowa, A. Marston, C. F. Curtiss, and T. H. Macdonald	709
Third annual report of the State board of public roads, Rhode Island	709
Eighth annual report of the commissioner of highways, Ontario, 1903	709
Hydraulic motors, I. P. Church	710
A steam traction engine, R. Dessaisaix	710
Methods of testing farm machines, A. Nachtweh	710
Methods of testing farm machinery, A. Nachtweh	710
New farm machinery, E. Wrobel	710
New farm machinery, A. Nachtweh	710
New farm machinery, K. Vormfelde	710
New farm machinery; the Heller plow for subsoiling, B. Tolksdorf	710

RURAL ECONOMICS.

The state and agriculture in Hungary, I. Darányi, trans. by A. György	710
The business side of farming, F. W. Card	711
The economics of good roads, W. E. McClintock	711
The sugar production of the world, H. Paasche	711
Crop Reporter	711
Statistical yearbook of Austria, 1904	712
Annual statistical report of the Tokyo Chamber of Commerce, 1905	712
Annual report of bureau of industries for Province of Ontario, 1904	712
State of Washington, its resources, natural, industrial, and commercial, 1905	712

AGRICULTURAL EDUCATION.

Agricultural education in Belgium	712
Place of the agricultural and mechanical college, B. Ayres	713
Nature study and agriculture	713
Syllabus for secondary schools. Physical geography and agriculture	713
Agriculture in the public schools, F. Mutchler	714
School gardens, B. T. Galloway	714
Municipal school gardens, Philadelphia, Helen C. Bennett	714
The ideal forestry college	714
Forest school, H. S. Graves	714
Soil and drainage, A. B. Graham	714
The educational beehive, E. F. Bigelow	715
Suggestions for grain-growing contests, C. P. Bull	715
Legislation relating to farmers' institutes in United States, J. Hamilton	715
Organization lists of agricultural colleges and experiment stations in U. S	715

MISCELLANEOUS.

Eighteenth Annual Report of Illinois Station, 1905	715
Twenty-fourth Annual Report of Ohio Station, 1905	715
Twenty-first Annual Report of the Bureau of Animal Industry, 1904	715
Experiment Station Work, XXXI	716
Experiment Station Work, XXXII	716
Press bulletins	716
Index of Massachusetts State Station publications, vols. 1–12, 1883–1894	716
Agriculture in Denmark	716

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Idaho Station: Page.
Bul. 50, Sept., 1905 709
Bul. 51, Sept., 1905 643
Illinois Station:
Bul. 104, Oct., 1905 677
Eighteenth An. Rpt., 1905 ... 715
Maine Station:
Bul. 119, Oct., 1905 685
Maryland Station:
Bul. 106, Sept., 1905 658
Bul. 107, Oct., 1905 678
Massachusetts Station:
Met. Buls., 203–204, Nov.–Dec., 1905 637
Index Number (State Station, 1883–1894), 1905 716
Minnesota Station:
Bul. 92, May, 1905 681
Mississippi Station:
Bul. 89, Jan., 1905 640
Bul. 90, Aug., 1905 679
Bul. 91, Sept., 1905 651
Nebraska Station:
Bul. 90, Nov. 25, 1905 688
Bul. 91, Dec. 5, 1905 657
New Hampshire Station:
Bul. 120, Sept., 1905 693
New York Cornell Station:
Bul. 233, Oct., 1905 680
New York State Station:
Bul. 270, Nov., 1905 648
North Dakota Station:
Bul. 67, Dec., 1905 636
Ohio Station:
Bul. 163 (Twenty-fourth An. Rpt., 1905), June, 1905 ..... 638, 715, 716
Bul. 164, July, 1905 675
Bul. 165, Aug., 1905 660
Bul. 166, Sept., 1905 664
Oklahoma Station:
Bul. 68, Dec., 1905 ..... 647, 648
Bul. 69, Dec., 1905 664
Tennessee Station:
Bul., vol. 18, No. 2, Sept., 1905 665
West Virginia Station:
Report of Work under Chapter XXXIII of Acts of 1901 679
Wyoming Station:
Bul. 67, Aug., 1905 706
Bul. 68, Oct., 1905 689

U. S. Department of Agriculture.

Farmers' Bul. 232 665
Farmers' Bul. 233 716
Farmers' Bul. 234 692
Farmers' Bul. 235 709
Farmers' Bul. 236 691
Farmers' Bul. 237 716
Bureau of Animal Industry:
Bul. 75 (15 cents) 693
Bul. 76 (5 cents) 688
Bul. 77 (5 cents) 687
Circ. 79 700
Circ. 80 698
Circ. 81 688
Twenty-first An. Rpt., 1904 (55 cents) 686, 689, 690, 691, 692, 693, 699, 702, 704, 715
Bureau of Biological Survey:
Bul. 24 (10 cents) 676
Bureau of Chemistry:
Bul. 91 (10 cents) 641
Bureau of Entomology:
Bul. 10 (tech. ser.), (5 cents) . 678
Bureau of Forestry:
Bul. 56 (10 cents) 668
Bureau of Plant Industry:
Bul. 87 (5 cents) 670
[Circ.], Jan. 9, 1904 659
Bureau of Soils:
Circ. 16 646
Circ. 17 646
Bureau of Statistics:
Crop Reporter, vol. 7, Nos. 7–8, Nov.–Dec., 1905 711
Weather Bureau:
Monthly Weather Review, vol. 33, Nos. 6–9, June–Sept., 1905 (20 cents per number, $2 per year) 636, 669
Office of Experiment Stations:
Bul. 135 (rev. ed.), (5 cents) . 715
Bul. 158 (45 cents) 704
Bul. 159 (15 cents) 681
Bul. 160 (10 cents) 714
Bul. 161 (5 cents) 715

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.
Field Crops—J. I. SCHULTE.
Horticulture and Forestry—C. B. SMITH.
Zootechny and Human Nutrition—C. F. LANGWORTHY, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. LAWSON.
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and H. W. LAWSON.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. WILCOX, Ph. D.
Rural Engineering—R. P. TEELE.
Rural Economics—H. C. TAYLOR, Ph. D.
Agricultural Education—D. J. CROSBY.

CONTENTS OF VOL. XVII, NO. 8.

Page.

Editorial notes:
The further endowment of experiment stations 725
Some changes since the passage of the Hatch Act 725
New responsibilities under the Adams Act 729
Recent work in agricultural science 731
Notes 820

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Determination of citric-acid soluble and total phosphoric acid, F. Mach 731
Simple method of determining phosphoric acid, potash, etc., H. Neubauer 731
Titanium, H. Pellet and C. Fribourg 732
Determination of titanic acid in soils and plants, H. Pellet and C. Fribourg 732
Influence of titanium on determination of aluminum and phosphoric acid, H. Pellet and C. Fribourg 732
Occurrence of alumina in plants, H. Pellet and C. Fribourg 732
Methods of organic analysis, H. C. Sherman 732
New method for estimation of sugar, B. Wagner and A. Rinck 733
Globulin, J. Mellanby 733
Cleavage of edestin of cotton seed, F. Ajderhalden and B. Reinbold 733
Carbon tetrachlorid, B. M. Margosches 733
Laboratory handbook for analysis of milk, butter, and cheese, J. R. Evans 733
Application of "sin-acid" butyrometry to milk, C. Beger 733
Contribution to the cryoscopic examination of milk, O. Allemann 734
Determination of hydrogen peroxid in milk, S. Amberg 734
Identification of boric acid, O. von Spindler 734
Formaldehyde and its reactions, J. Schuch 734

METEOROLOGY—WATER.

Report of the Chief of the Weather Bureau for 1906, W. L. Moore 734
Monthly Weather Review, Vol. XXXIII, Nos. 10, 11 735
Meteorology and climatology, W. Trabert 735

Page.

Meteorological chart of the Great Lakes, A. J. Henry and N. B. Conger 735
Temperature and relative humidity data, W. B. Stockman 736
Meteorology of Southern Asia and neighboring countries, J. Eliot 736
British rainfall, 1904 736
Chlorin in rain water 737
Composition of Barbados rainfall 737
Contribution to rainfall régime of region of Boulogne, G. Ventura 737
Rainfall in the agricultural districts, G. G. Bond 737
Thunder and lightning, C. Flammarion, trans. by W. Mostyn 737
The pulse of the atmospheric circulation, W. N. Shaw 737
Investigation of the upper air 737
Improved methods for finding altitude and azimuth 737
Daily river stages at river gage stations, 1900–1904, H. C. Frankenfield 737
Report on the underground waters of Louisiana, W. C. Stubbs et al 738
Influence of summer rains on the flow of springs, Houllier 738
Water softening at Oberlin, Ohio, W. B. Gerrish 738
The sterilization of water by ozone, A. Steens 738
Purification of water by copper sulphate, D. D. Jackson 738
New method for detecting pollution of water, L. Heim 738
Water supply and sewerage 739
The bacteria of the air, water, and soil, E. Bodin 739

SOILS—FERTILIZERS.

Field operations of Bureau of Soils, 1904 (sixth report), M. Whitney et al 740
Recent work of the American Soil Bureau, E. J. Russell 742
Soil investigation and technology of soils, E. Ramann 742
Mineral constituents of soil solution, F. K. Cameron and J. M. Bell 742
Comparison of results of cultures in paraffined pots with field results, H. J. Wheeler et al 743
Unproductive soils, T. Biéler-Chatelan 744
Some changes in soil under influence of earthworms, A. Murinov 744
Influence of weak electric current on solubility, etc., M. Yegorov 745
Hygroscopicity, heat evolved on moistening (Benetzungswärme), and mechanical analysis of soils, A. Mitscherlich 745
Soil and subsoil of the Veliko-Anadolsk forest, N. N. Stepanov 745
Does the northern forest dry the soil? D. M. Kravchinski 745
On the origin of moors, C. A. Weber 745
Calcium carbonate in some soils of Valpantena (Verona), R. De Polo 746
Volatilization of ammonium salts in soils, H. Wangnick 746
Soils and fertilizers, H. Snyder 746
Fertilizer inspection, C. D. Woods and J. M. Bartlett 746
Analyses of commercial fertilizers, M. B. Hardin 746
Commercial fertilizers, H. J. Wheeler et al 746
The utilization of atmospheric nitrogen, O. N. Witt 746
Nitric acid and nitrates from the nitrogen of the air 747
Calcium nitrate manufacture in Norway 747
The new Norwegian industry of manufacture of "lime niter" 748
Nitrate of calcium factory for Norway, H. Bordewich 748
Utilization of the nitrogen of the air 748
Production of nitric acid from the air, M. Bodenstein 748
Nitric acid from atmospheric nitrogen, F. Winteler 748
Utilization of the nitrogen of the air, A. Neuburger 748
Lime nitrogen and its fertilizing value, H. Immendorff and O. Thielebein 748
Fixation of nitrogen and electrochemistry, P. A. Guye 749
Agriculture and the nitrogen supply, L. Grandeau 749
The nitrogen balance of soils 749
Note on the fate of calcium cyanamid in the soil, S. F. Ashby 749
Calcium cyanamid (lime nitrogen), L. Grandeau 749
Experiments with lime nitrogen 749
Experiments with lime nitrogen, von Seelhorst and A. Müther 749
Fertilizing value of calcium cyanamid (lime nitrogen), L. Grandeau 750
Life conditions of nitrogen-collecting bacteria, H. Fischer 750
Inoculation of legumes, K. F. Kellerman and T. R. Robinson 750

AGRICULTURAL BOTANY.

	Page.
Experiments with plants, W. J. V. Osterhout	750
The proteases of plants, III, S. H. Vines	750
Nitrogen nutrition of chlorophyll-bearing plants, O. Treboux	751
Studies of endotrophic mycorrhiza, I. Galland	751
Heliotropism indirectly caused by radium, H. Molisch	752
Hemicellulose as a reserve material in forest trees, H. C. Schellenberg	752
Wild medicinal plants of the United States, Alice Henkel	752
International catalogue of scientific literature. M—Botany	752

FIELD CROPS.

The thorough tillage system for the plains of Colorado, W. H. Olin	752
Fallow culture of chernozem, S. V. Shchoosyev	753
Fertilizer demonstration work in 1904, H. Svoboda	753
Influence of cultivation of moorland meadows, E. Wein	753
Report on experimental farms in Central Provinces, 1904–5, C. E. Low	754
Experiments at Burgoyne's Farm and other centers, T. H. Middleton	754
The agathi plant	755
Does potash reduce protein content of malting barley? O. Reitmair	755
Does potash reduce protein content of malting barley? J. Stoklasa	756
Importance of stooling capacity of cereal breeding, J. Sperling	756
Drilling clover seed with the nurse crop, Bachmann	756
Selecting and preparing seed corn, P. G. Holden	756
Amount of water used by growing corn, R. W. Clothier	756
What is an ear of corn? E. G. Montgomery	757
Weevil-resisting adaptations of the cotton plant, O. F. Cook	757
Cotton growing in Guilford County, J. H. Bluford	758
The culture of cotton in Argentina, C. D. Girola	758
Possibilities of cotton growing in East Africa, A. Linton and E. Brand	758
Specific effect of phosphoric acid on oat plants, H. Clausen	759
Effect of soil compression on oats, C. von Seelhorst and Krzymowski	759
Influence of soil moisture on oats, C. von Seelhorst and Krzymowski	759
Structure of oat and barley stems and its relation to production, C. Kraus	760
Cooperative variety tests with peas, 1902–1904, W. Edler	760
Varieties of potatoes, W. Bruce	760
Effect of fertilizers on quality of root crops and potatoes, M. Weibull	760
Serradella and red clover in rotation, R. Guthke	761
Fertilizer tests with sugar beets in 1901 and 1902, S. L. Frankfurt et al	761
Use of shelled and disinfected beet seed	761
Comparative analyses of varieties of cane, C. F. Eckart	761
Manurial experiments with sugar cane, J. P. d'Albuquerque and J. R. Bovell	762
Varieties of sugar cane, J. P. d'Albuquerque and J. R. Bovell	762
Relation between stem and root development in sugar cane, Z. Kamerling	763
Report of division of agriculture and chemistry [Hawaii], C. F. Eckart	763
Value of shelled timothy seed, H. von Feilitzen	763
A study of Deli tobacco, D. J. Hissink	763
The storage and germination of wild rice seed, J. W. T. Duvel	764
Report of Seed-Testing Laboratory of Aynsome Station, J. S. Remington	764
The destruction of dodder, E. Marre	764

HORTICULTURE.

Causes which make soil of old gardens unsuitable for certain vegetables	765
A rust-resisting cantaloupe, P. K. Blinn	765
Fertilizer for peas, H. Blin	765
Manuring gumbo, H. Blin	765
The mutations of Lycopersicum, C. A. White	766
The American peppermint industry, A. M. Todd	766
Peppermint, Alice Henkel	766
Shading pineapples	766
Fertilizing apple trees, F. A. Waugh	766
Relation of soil texture to apple production, H. J. Wilder	767
Apple scions from bearing trees. Influence of the stock	767

Page.

Handling the apple crop, H. H. Hume 767
The short apple crop of 1905 767
Pomology of Finistère, J. Crochetelle 767
Citrus fruit growing in the Gulf States, P. H. Rolfs 767
Citrus fruits in Hawaii, J. E. Higgins 767
Growing oranges under tents, H. V. Horgan 767
The pomelo 768
South Australian fruit at the Brisbane national show, G. Quinn 768
Packing and marketing fruits, F. A. Waugh 768
Experiments in cold storage of fruits, J. Knight 768
Sterilizing fruit 768
Method of preventing the rapid decay of ripe fruit 768
Preparation of fruit pulp 768
The use of lye in fruit canning 769
Pimento growing in Jamaica, A. Roxburgh 769
Cultivation of tea in Jamaica 769
The technology of tea, H. Neuville 769
Manurial experiments with cacao at Dominica, F. Watts 769
Grafting cacao, J. Jones 769
[Notes on varieties of chestnuts] 769
Systematic amelioration of grapes by the graft, A. Jurie 769
Fertilizer experiments with grapes, H. Schellenberg 769
Interpretation of analytical results in manuring grapes, A. Hubert 770
Roses and how to grow them 770
Carnation breeding, C. W. Ward 770
The chrysanthemum, A. Herrington 770
Chemical study on culture of chrysanthemums, A. Hébert and G. Truffaut 770
A study of perennial garden phlox, C. J. Hunt 771
The culture of fringed gentian, T. Murray 771
New creations in plant life, W. S. Harwood 771

FORESTRY.

Handbook of the trees of California, Alice Eastwood 771
Advice for forest planters in Oklahoma and adjacent regions, G. L. Clothier 771
Report Irish Forestry Society 771
Report of forest administration in United Provinces, 1903–4, L. Mercer et al 771
Transplanting of bigtree seedlings, S. J. Flintham 772
Seed bed fertilizer experiments on sandstone soils, Vater 772
Natural replacement of white pine on old fields in New England, S. N. Spring 772
Loblolly pine in eastern Texas, R. Zon 773
Cultivation and fertilizers for stunted pine stands, F. Hofmann 773
Spruce seed sown broadcast, A. Knechtel 773
Influence of thinning on the stem form of spruce, M. Kunze 774
Maple sugar industry, W. F. Fox and W. F. Hubbard 774
Germinating Para rubber seeds 774
The cultivation and preparation of Para rubber, W. H. Johnson 774
The rubber industry in Peru, J. M. von Hassel 774
Report on rubber in the Gold Coast, W. H. Johnson 774
Investigations of kickxia caoutchouc from Cameroons 775
Handbook of timber preservation, S. M. Rowe 775
A new impregnation treatment for wood, G. Janka 775
Turning sawmill waste into water-white turpentine 775

DISEASES OF PLANTS.

Fungus diseases in India in 1903, E. J. Butler 775
Some investigations of plant diseases 776
Frost blisters and their origin, F. Noack 776
Internal infection of wheat grain by rust, H. L. Bolley and F. J. Pritchard 776
Symbiosis in Lolium, A. Nestler 777
Contribution to the biology of ergots, R. Stäger 777
Black scab of potatoes, J. W. Eastham 777
Methods of spraying cucumbers and melons, W. A. Orton and W. D. Garrison 778

Page.
Inspection and disinfection of cane cuttings, N. A. Cobb 778
Preliminary notes on root disease of sugar cane in Hawaii, L. Lewton-Brain.. 778
Third report on gumming of the sugar cane, N. A. Cobb 778
The red string of the sugar cane, R. G. Smith 779
Crown-gall and hairy-root diseases of the apple tree, G. G. Hedgcock 779
A new apple rot, B. O. Longyear 780
California vine or Anaheim disease—its cause and nature, H. Hoops 780
Black rot and its treatment, A. Prunet 781
Treatment of mildew, L. Degrully 781
The proper application of copper fungicides, L. Degrully 781

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Destruction of birds by the elements, 1903–4, E. H. Forbush 781
The quail, the best insect and weed exterminator, E. Harris 781
Fruit-eating birds, C. French, jr 781
Report of committee on gypsy moth, insects, and birds, A. Pratt et al 781
Some miscellaneous results of work of Bureau of Entomology, VIII 781
Thirty-fifth annual report of the Entomological Society of Ontario, 1904 782
Leaf hoppers and their natural enemies, R. C. L. Perkins 783
Combating scale insects, Trabut 783
May flies and midges of New York, J. G. Needham et al 784
Report of the entomologist, C. B. Simpson 784
The monthly bulletin of the division of zoology, H. A. Surface 784
Cooperative spraying experiments, M. V. Slingerland 784
The insect pests of cotton, H. A. Ballou 785
The cotton red spider, E. S. G. Titus 785
Insect enemies of tobacco in Hawaii, D. L. Van Dine 785
Review of the insect pests affecting sugar cane, H. A. Ballou 785
The joint-worm, F. M. Webster 785
The cottony grass scale, Edith M. Patch 785
Control of codling moth, T. W. Kirk 786
Descriptions of three species of fruit flies, T. Broun 786
A mite disease of grapevines, F. Bœuf 786
Insects attacking cacao in the West Indies, H. A. Ballou 786
The cottony maple scale, J. G. Sanders 786
The bronze birch borer, M. V. Slingerland 786
Ants, W. W. Froggatt 786
Introduction of bees to Australia, A. Gale 787
Bee culture, I. Hopkins 787
The nutrition of the bee, T. Cherry 787

FOODS—HUMAN NUTRITION.

Relation of population to food products, Y. Guyot 787
Seaweed industries of Japan and utilization of seaweeds in U. S., H. M. Smith. 787
Report of the Commissary-General to the Secretary of War, J. F. Weston 787
Food legislation, W. D. Bigelow 787
Review of literature of foods for 1904, A. J. J. Vandevelde and M. Henseval.. 787
Pure food 788
Food preservatives, their advantages and proper use, R. G. Eccles 788
Coloring matters for foodstuffs and their detection, W. G. Berry 788
Use of coal tar colors in food products, H. Lieber 788
Composition of West Indian foods, M. Greshoff et al 788
Analyses of some Martinique food plants, P. Ammann 788
Value of wheat for bread-making purposes, F. F. Bruyning, jr 788
A study of durum wheat, F. A. Norton 789
The assimilation of whole-wheat bread, P. Fauvel 789
The nutritive value of different sorts of flour, P. Fauvel 789
The formation of acid in mixtures of flour and water, G. Geisendörfer 789
Testing wheat flour for commercial purposes, H. Snyder 789
Talc as a coating for pearl barley, etc., H. Matthes and F. Müller 789
A soy bean bread containing no starch, Bardet 790
Studies of canned meat, E. Carlinfanti and A. Manetti 790
Liebig's meat extract, I, F. Kutscher 790

Page

Chinese duck egg yolk, H. Lührig 790
The spoiling of eggs, H. Schlegel 790
Studies of spoiled canned vegetables, J. Belser 790
Hop sprouts as vegetables, G. W. Roosevelt 790
To what constituent does coffee owe its stimulating properties? M. Geiser 790
Composition of Java cane-sugar molasses, H. C. Prinsen Geerligs 790
The adulteration of maple products, H. W. Wiley 790
Maple sirup and sugar, T. Macfarlane 791
Concerning the dextrin found in honey from Coniferæ, P. Wolff 791
Laboratory experiments on the digestibility of dried milk, D. Sommerville 791
Importance of inorganic salts in metabolism, A. Hirschler and P. Terray 791
Liberation of energy in fasting and fed animals, A. Chauveau 792
A study of the metabolism of a vegetarian, J. M. Swan 792
Influence of the temperature of food upon the stomach, J. Mueller 792
Relation of creatinin excretion to variations in diet, W. Koch 792
The peptic cleavage products of the wheat proteid artolin, H. Hayashi 793
Carbon-dioxid production when lying down and standing up, K. E. Widlund 793
Presence, quantity, and origin of uric acid in feces, F. Galdi 793

ANIMAL PRODUCTION.

Dried beets as a sugar-yielding feeding stuff, A. Muntz and A. C. Girard 793
Feeding stuffs, F. T. Holbrook and E. J. Russell 793
Oil content of cotton seed grown in Central Asia, D. Tschernewsky 794
Profitable stock feeding, H. R. Smith 794
Steer-feeding experiment, VII, 1903–4, O. Erf et al 794
Methods of steer feeding, T. I. Mairs and N. G. Miller 794
Feeding trials, M. J. R. Dunstan 795
Calf rearing, M. J. R. Dunstan 795
Crossbred sheep, T. R. Robinson 795
Shearing lambs, M. J. R. Dunstan 795
Maltese goats, J. H. Grout 795
Type of horse that may be profitably raised in New England, H. W. Smith 795
Influence of radium bromid on metabolism, W. N. Berg and W. H. Walker 795
An improved cage for metabolism experiments, W. J. Gies 795
The farmer's poultry house, F. W. Hodson and F. C. Elford 795
Relative efficiency of poultry houses, T. R. Robinson and E. J. Russell 796
A practical poultry plant for southern California, E. P. Mitchell 796
The poultry, T. R. Robinson 796
Adaptability of concentrated by-products for poultry feeding, W. P. Wheeler 796
Feeding cotton-seed meal to chickens 797
Growth of chickens and cost of rearing, E. Brown 797
Eggs of domestic ducks and hybrid ducks, G. Loisel 798
The guinea fowl, H. de Courcy 798

DAIRY FARMING—DAIRYING.

Comparison of wheat bran and cotton-seed meal, J. Michels and J. M. Burgess 798
In what way is the feeder responsible for unsanitary milk? W. H. Jordan 799
Milk-testing societies in Sweden 799
On obtaining pure milk for infants, children, and invalids, W. Hempel 799
The sale of milk for human consumption, M. Casalini 799
Methods of bacteriological examination of milk, F. H. Slack 799
The microscopic estimate of bacteria in milk, F. H. Slack 799
The bacteriological examination of milk, A. C. Houston 800
Lactic-acid bacteria, W. M. Esten 800
Kinds of bacteria concerned in souring of milk, P. G. Heinemann 800
A note on the indol-producing bacteria in milk, S. C. Prescott 800
Bacteriological studies of milk of abnormal properties, R. Burri and M. Düggeli 800
The quantitative determination of leucocytes in milk, A. R. Ward 801
On the reductases of cows' milk, E. Seligmann 801
Biological and biochemical studies on milk, C. J. Koning 801
Proteolysis in cows' milk, W. G. Tice and H. C. Sherman 801
Domestic butter, A. McGill 802

Page.
Contribution to knowledge of Holland butter, A. Olig and J. Tillmans 802
Butter making on the farm, E. H. Webster 802
Use of pure cultures in manufacture of Grana cheese, C. Gorini 802
Investigations on sour-milk cheese, C. H. Eckles 803
The ripening of Hartz cheese, II, C. H. Eckles and O. Rahn 803
Care of dairy utensils, O. Erf and C. W. Melick 803
Missouri State Dairy Association 803

VETERINARY MEDICINE.

Diseases of cattle, sheep, goats, and swine, G. Moussu and J. A. W. Dollar ... 804
Annual report of [Ohio] State board of live stock commissioners 804
Infectious diseases of animals and the live-stock industry, P. Fischer 804
Annual report on distribution of animal plagues in the German Empire 804
The veterinary section, A. Theiler 804
Immunization with exudates and bacterial extracts, J. Citron 804
Transportation of tetanus toxin through nerve fibers, N. Tiberti 805
Report on human and bovine tuberculosis, H. Kossel 805
Tuberculosis, methods of combating it, E. von Behring 805
Immunization of cattle against tuberculosis, E. von Behring 806
Action of tubercle bacilli of different origin, R. Link 806
Tuberculosis in cattle and tuberculin tests of station herd, J. M. Scott 806
Vaccination against tuberculosis in Melun, E. Thierry 806
Disease caused by inoculation with fat-free tubercle bacilli, J. Cantacuzene ... 807
Ranilla, J. C. Segura 807
Abortion in cows, T. W. Cave 807
Treatment of infectious vaginal catarrh, Attinger 807
Parasitic gastro-enteritis, F. G. Ashley 807
Mortality in cattle caused by eating poison tulip, J. D. Stewart 808
Occurrence of hydrocyanic acid in Johnson grass, M. E. Jaffa 808
The poisonous action of Johnson grass, A. C. Crawford 808
Diseases of sheep, T. W. Cave 808
Anthrax in the horse, J. R. McCall 808
Agglutinins and precipitins in the blood during glanders, A. Bonome 808
Diagnostic value of agglutination in glanders, J. Schnürer 809
Unity of dourine, G. E. Schneider and M. Buffard 809
Studies on *Trypanosoma duttoni*, Thiroux 809
Trypanosomes in the blood of inoculated animals, A. Nissle 809
Experimental trypanosome diseases, L. Halberstaedter 809
Trypanosomes and their presence in blood of Brisbane rats, C. J. Pound 809
A new endoglobular hematozoan, J. J. Vassal 809
The spread of plague infection by insects, W. Hunter 809
The tapeworms of Australia, N. A. Cobb 809
Method of distribution of trichina embryos, C. Stäubli 810
Infectious pneumonia of rabbits and its treatment, H. J. Südmersen 810
Serum treatment for dog distemper, A. H. Meis 810
Study of mixtures of antirabies serum and fixed virus, P. Remlinger 810
Protection of dogs against rabies by fixed virus and serum, A. Marie 810
So-called premonitory fever as symptom of experimental rabies, J. von Löte . 811
Action of radium rays upon virus of rabies, G. Tizzoni and A. Bongiovanni .. 811
Sleepy disease of chickens, C. Dammann and O. Manegold 811
Protective properties of blood from animals affected with fowl cholera, E. Weil 811

RURAL ENGINEERING.

Hydrologic work of Geological Survey in eastern United States, M. L. Fuller .. 812
Hydrographic work of U. S. Geological Survey, G. B. Hollister 812
Prehistoric irrigation in the Navaho Desert, E. L. Hewett 812
Irrigation in Mildura, C. J. Grant 812
Season and crop report of Bombay Presidency, 1904–5, H. S. Lawrence 812
The use of water in France, A. Backhaus 813
Preparation of land and practical application of water, F. G. Chomley 813
The size of irrigated farms 813

Page.
Diminished yield of underground waters in southern California 813
The value of meadows and their irrigation, Strecker 814
Water as a plant food, Backhaus 814
Cultivation of salt lands, A. Rolet 814
Laying out rice plantations, G. Carle 814
Terrestrial magnetism and meridian line work in Louisiana, W. C. Stubbs et al .. 814
The model farm, F. Graftiau and E. Warnants 814
Wind for electric power, F. von Lepel 815
The electrical value of wind power 815
British progress in pumps and pumping engines, P. R. Björling 815
The farm automobile, G. Voigtmann 815
Construction and ventilation of farm buildings 815
Implements and machinery at the Smithfield Show 815
Farm machinery in Belgium during the past twenty-five years, J. Pyro 815
Ancient Egyptian farm implements, A. De Céris 816
Recent improvements in hay making 816
The corrosion of fence wire, A. S. Cushman 816
Teaching agricultural engineering in land-grant colleges, C. J. Zintheo 816

RURAL ECONOMICS.

Farming as a business enterprise, E. C. Parker 816
The poor and the land, H. R. Haggard 816
Grazing on the public lands 817
The world's grain production in 1905 817

AGRICULTURAL EDUCATION.

Agricultural education in Lancashire, J. Bayne 818
Agricultural college extension 818
Popular agricultural education in Jamaica, J. R. Williams 818
Syllabus of lecture on profitable cattle feeding, F. B. Mumford 819
Syllabus of lecture on silage and silo construction, A. M. Soule 819
Syllabus of lecture on field experimentation, C. E. Thorne 819

MISCELLANEOUS.

Eighteenth Annual Report of Georgia Station, 1905 819
Hawaiian Sugar Planters' Station Report, 1905 819

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

	Page.
Colorado Station:	
Bul. 103, Oct., 1905	752
Bul. 104, Nov., 1905	765
Bul. 105, Nov., 1905	780
Georgia Station:	
Eighteenth An. Rpt., 1905	819
Hawaii Station:	
Bul. 9, 1905 (5 cents)	767
Bul. 10, 1905 (5 cents)	
Hawaiian Sugar Planters' Station:	785
Div. Agr. and Chem. Bul. 12, Mar. 6, 1905	761
Div. Ent. Bul. 1, pts. 5–8, Nov., 1905–Jan., 1906	783
Div. Path. and Physiol. Bul. 1, Mar. 23, 1905	778
Div. Path. and Physiol. Bul. 2, Oct. 12, 1905	778
Div. Path. and Physiol. Bul. 3, Oct. 20, 1905	778
An. Rpt., 1905	763, 819
Iowa Station:	
Bul. 77 (rev. ed.), Dec., 1905	756
Kansas Station:	
Bul. 130, Apr., 1905	794
Bul. 131, Apr., 1905	803
Louisiana Stations:	
Geol. Survey Bul. 1, 1905	738
Geol. Survey Bul. 2, 1905	814
Maine Station:	
Bul. 120, Dec., 1905	746
Bul. 121, Dec., 1905	785
New Mexico Station:	
Bul. 55, June, 1905	806
New York Cornell Station:	
Bul. 234, Jan., 1906	786
Bul. 235, Jan., 1906	784
New York State Station:	
Bul. 271, Dec., 1905	796
Pennsylvania Station:	
Bul. 74, Oct., 1905	794
Rhode Island Station:	
Bul. 109, Oct., 1905	743
Bul. 110, Nov., 1905	746
South Carolina Station:	
Bul. 115, May, 1905	746
Bul. 116, Oct., 1905	778
Bul. 117, Dec., 1905	798

U. S. Department of Agriculture.

	Page.
Farmers' Bul. 238	767
Farmers' Bul. 239	816
Farmers' Bul. 240	750
Farmers' Bul. 241	802
Bureau of Chemistry:	
Circ. 25	788
Bureau of Entomology:	
Bul. 54 (10 cents)	781
Circ. 64	786
Circ. 65	785
Circ. 66	785
Bureau of Forestry:	
Bul. 59 (5 cents)	774, 790
Bul. 62 (15 cents)	817
Bul. 63 (10 cents)	772
Bul. 64 (5 cents)	773
Bul. 65 (5 cents)	771
Bureau of Plant Industry:	
Bul. 88 (10 cents)	757
Bul. 89 (5 cents)	752
Bul. 90, pt. 1 (5 cents)	764
Bul. 90, pt. 2 (5 cents)	779
Bul. 90, pt. 3 (5 cents)	776
Bul. 90, pt. 4 (5 cents)	808
Bureau of Soils:	
Bul. 30 (5 cents)	742
Field Operations, 1904 (Sixth Report), (cloth, $—; paper, $—)	740
Weather Bureau:	
Bul. O	736
Doc. 336	737
Doc. 338	734
Doc. 339 (cloth, $13; paper, $11)	737
Met. Chart Great Lakes, 1905, No. 1 (10 cents)	735
Monthly Weather Review, vol. 33, Nos. 10–11, Oct.–Nov., 1905 (20 cents per number, $2 per year)	735
Office of Experiment Stations:	
Farmers' Inst. Lecture 4 (5 cents)	819
Farmers' Inst. Lecture 5 (5 cents)	819
Farmers' Inst. Lecture 6 (5 cents)	819

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D.
Rural Engineering—R. P. Teele.
Rural Economics—H. C. Taylor, Ph. D.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 9.

	Page.
Editorial notes:	
Elementary training for the productive industries	825
Progress in making the nitrogen of the air available to agriculture	827
Recent work in agricultural science	830
Notes	925

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Analysis and control of agricultural products, L. Grandeau	830
Methods of analysis of fertilizers in different countries, L. Sicard	830
Importance of uniform international methods of analysis, H. Nissenson	830
New method for determination of atmospheric carbon dioxid, H. T. Brown and F. Escombe	830
Determination of carbon monoxid in the air, Albert-Lévy and A. Pécoul	831
Determination of sulphuric acid in drinking water, F. Raschig	831
Field assay of water, M. O. Leighton	831
Theory of formation of potash deposits from sea water, E. Jänecke	831
Methods used in soil investigations, O. Schreiner and G. H. Failyer	831
Determination of nitric acid in soils, Buhlert and Fickendey	832
Determination of aluminum, H. Weber	832
Examination of foods, condiments, and commercial products, M. Mansfeld	832
Glutaminic acid yielded by vegetable proteins, T. B. Osborne and R. D. Gilbert	852
Concerning the detection of boric acid, G. Fendler	833
Curcuma paper for boric acid reaction, L. Wolfrum and J. Pinnow	833
Estimation of sulphurous acid in certain foods, T. Schumacher and E. Feder	833
Detection of talc and coloring matter in grits and rice, E. von Raumer	833
Occurrence of cholesterin and lecithin in milk, M. Siegfeld	833
Accuracy of Wollny refractometer, Gottlieb method, etc., H. Schrott-Fiechtl	833
New nonacid method for rapid determination of fat in milk, N. Gerber	833

Page.

Formalin as means of preventing plugging in determination of fat, C. Beger 833
Determination of the fat content of butter, H. Lührig 834
New method for detection of cocoanut oil in butter, Wysman & Reijst 834
Value of Schiff's reagent for detection of formaldehyde in milk, Utz 834
Relation of cows' milk to Schiff's reagent and a test for formalin, E chhol z 834
Separation of nitrogenous bodies in cheese, R. Harcourt 834
Extracts from proceedings of Official Agricultural Chemists, 1905, H. W. Wil y 834
Agricultural chemis ,y, . Morgen and W. Zielstorff 834

METEOROLOGY—WATER.

Text-book of meteorology, J. Hann 835
The study of meteorology, F. Waldo 835
Recent advances in meteorology and meteorological service in Japan, S. T. Tamura 835
Weather report, 1905, J. B. Reynolds 835
Meteorological observations, J. E. Ostrander, C. H. Chadwick, and T. A. Barry 835
Report of meteorologist, N. Helme 835
Meteorological data, H. L. Price 836
Observations on the intensity and duration of rainfall, A. Woeikof 836
Rainfall per day and hour in Northwest England, A. Woeikof 836
Distribution of summer rains in Germany, E. Less 836
Possible period of sunshine and its normal value for Germany, Grossmann 836
Relation of temperature of the layers of the air, A. Woeikof 836
Daily temperature periods in lowest layer of the air, M. Sassenfeld 836
Importance of drainage for elimination of danger from frost, L. Lindelöf et al 836
International catalogue of scientific literature. F—Meteorology 836
Lightning report, J. B. Reynolds 836
Geology and water resources of Oklahoma, C. N. Gould 836
Preliminary list of deep borings in United States, N. H. Darton 837
Purification of waters for industrial purpos s, D. Peniakoff 837
Sterilization of water by me ns of ozone, E. Pilatte 837
Notes on water softening, W. M. Gardner and L. L. Lloyd 837
Hints on water supply 837
The sanitary protection of water supplies, K. Allen 837
The sanitary value of a water analysis, L. P. Kinnicutt 838
Detection of fecal contamination of drinking water, Christian 838
Sewerage and sewage purification, M. N. Baker 838
Review of laws forbidding pollution of inland waters in the United States, E. B. Goodell 838

SOILS—FERTILIZERS.

Treatise on soils for farmers and foresters, E. A. Mitscherlich 838
Classification and nomenclature of cultivated soils, H. Lagatu 839
The soil survey of Illinois, C. H. Oathout 839
Soils of the Bahama Islands, C. N. Mooney 839
Soils of Rhenish Palatinate and relation to geological formations, E. Blanck 839
The soil of Gascony, L. A. Fabre 840
Some observations on humus soils, G. Salomone 840
Marsh soils, F. Schucht 840
Swamp soils, R. Harcourt 840
Effect of different soils upon composition of crops, W. P. Gamble 840
Physical analysis of soils, J. B. Reynolds 840
Experiments on peat soil, W. H. Day 841
Experiments on aeration, W. H. Day 841
Experiments on evaporation and transpiration, W. H. Day 841
The constitution of arable soil, A. Delage and H. Lagatu 841
Soil builders at work, S. W. Fletcher 842
Feldspar and mica as sources of potash, D. N. Prianishnikov 842
Insoluble potassium compounds contained in humic substances, M. Berthelot 842

Tobacco seed distributed in 1905–6, A. D. Shamel and W. W. Cobey 860
Comparative values of different grades of wheat, R. Harcourt 860
Determination of the germinative power of grains, O. Qvam 860
Report of Danish seed control [station], 1903–4, K. Dorph-Petersen 861
Rules and regulations governing the Colorado Patterson seed selection competition, W. H. Olin and W. L. Carlyle 861

HORTICULTURE.

Report of the horticultural division, F. W. Card and M. A. Blake 861
Report of the professor of horticulture, H. L. Hutt 862
Vegetable growing in Alaska, C. C. Georgeson 863
Tomato culture, C. F. Austin and E. W. Halstead 863
Tomato growing, R. Thomson 864
Seed distribution of 1904 and for 1905, B. D. Halsted 864
Fruits for home orchards and gardens, T. V. Munson 864
Fruit and fruit utilization, H. Rühle 864
Pruning fruit trees, W. Paddock 864
Blooming periods of tree fruits, H. L. Price 864
Freezing of fruit trees, F. H. Hall and H. J. Eustace 865
Notes on varieties of apples, C. C. Newman 865
Handling the apple crop, H. H. Hume 865
Horticultural section, W. J. Palmer 865
About new hardy oranges, H. E. Van Deman 865
Timing of bananas 865
Bananas and pineapples, Y. Henry 865
Preserving fresh berry fruits, T. Zschokke 865
Does acid content of berry fruits decrease when cooked with sugar? W. Kelhofer 866
Changes in unripe gooseberries during after-ripening, W. Kelhofer 866
Report of the viticulturist, R. Bragato 866
Shallow culture of grapes, L. Degrully and L. Ravaz 866
Affinity of French scions with Rupestis du Lot, E. Zacharewicz 866
Tests of varieties of grapes, W. Kelhofer 866
Relation of sugar to weight of must and to acid in grape juice, W. Kelhofer 866
The Persian walnut, J. G. Rush 867
Queensland nut, W. J. Allen 867
Coleus with edible tubers, A. Chevalier and E. Perrot 867
Carnation breeding, H. F. Hall 867
Heeleaka [Tea] Experimental Station, H. H. Mann and C. M. Hutchinson 867
Society for Horticultural Science 868

FORESTRY.

The forester, J. Nisbet 868
Wood, J. Beauverie 868
The lumber industry 868
Evergreens; how to grow them, C. S. Harrison 868
Artificial fertilizers in forestry, Henze 868
Plan for the manuring of forests, Schwappach 868
The water content of diluvial forest soils, E. Ramann 868
Form and development of roots of the pine and other trees, A. Tolski 869
Root pruning forest trees 869
Root pruned trees 869
Note on increment of spruce in West Virginia and fire losses, B. E. Fernow 869
Rate of growth of red cedar, red oak, and chestnut, H. S. Graves 869
Rate of growth of birch in mountain regions of Jämtland, G. Andersson 870
Instructions for making forest maps and surveys, G. Pinchot 870
Report of the lecturer in forestry, E. J. Zavitz 870
Forest belts of western Kansas and Nebraska, R. S. Kellogg 870
Forest reserves in Idaho, G. Pinchot 871
Forestry in Maryland, W. D. Sterrett 871
Report of the superintendent of forests, W. F. Fox 871
Belgian woodlands and their management, F. H. Osmond-Smith 871
Forestry conditions and management of Bosnia and Herzegovina, L. Dimitz 871
Report of the conservator of forests, Natal, T. R. Sim 871

Page.
Forestry in Kiao-chou, Borgmann 872
Effects of frosts on forests of India, E. R. Stevens and E. A. Courthope 872
Para rubber in Ceylon 872
Experimental tappings of *Hevea brasiliensis*, W. R. Tromp de Haas 872

DISEASES OF PLANTS.

Recent researches on the parasitism of fungi, H. Marshall Ward 873
Some recent observations on plant diseases, P. Rippert 873
Endophytic adaptation shown by *Erysiphe graminis*, E. S. Salmon 873
Experiments with "biologic forms" of Erysiphaceæ, E. S. Salmon 873
The vegetative life of some Uredineæ, J. Eriksson 874
Report of the botanist and geologist, W. Lochhead 874
Treatment of grain for smut, C. A. Zavitz 874
Rust in oats, A. H. Cockayne 875
Bordeaux mixture for the potato blight, C. A. Zavitz 875
Prevention of potato rot, F. Parisot 875
Treatment for potato scab, C. A. Zavitz 875
White rust of tobacco and the mosaic disease, G. Delacroix 875
A bacterial disease of cabbages, cauliflower, etc., G. Delacroix 876
A fungus of the roots of the grapevine, L. Mangin and P. Viala 876
Combined treatment for prevention of downy and powdery mildew, J. Mossé 876
Mildew and gray rot 877
Treatment of black rot, L. Bergeyre 877
Black rot in Marmande, A. Guy 877
A remedy for the prevention of coulure, A. Bernet 877
Bud rot of cocoanut palm 877
A fungus on Para rubber leaves, H. N. Ridley 877
Effect of different soils on development of carnation rust, J. L. Sheldon 878
A new parasite of oxalis, L. Trabut 878
Comparative adherence of fungicides, E. Chuard and F. Porchet 879
A study of sulphur fungicides, J. B. Martin 879

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Report of the entomologist, H. Tryon 879
Insects injurious to corn, A. R. Kohler 879
Report on miscellaneous cotton insects in Texas, E. D. Sanderson 879
Coffee-leaf miner and other coffee pests, M. T. Cook and W. T. Horne 880
Treatment for the potato beetle, C. A. Zavitz 880
Apple maggot, F. W. Card and M. A. Blake 880
Spraying for San José scale, H. E. Hodgkiss, F. A. Sirrine, and E. L. Baker 880
Testing spray mixtures for San José scale, F. H. Hall et al 881
Some important scale insects, H. T. Fernald 881
The biology of *Ceratitis capitata*, A. Hempel 881
An insect of the family Poduridæ on grapevines, H. Faes 881
Stick or leaf insects, W. W. Froggatt 881
The Gryllidæ and wingless Locustidæ, W. W. Froggatt 882
The Black Hills beetle, A. D. Hopkins 882
Gall gnats injurious to osiers and willows, R. S. Macdougall 882
A treatise on the acarina, or mites, N. Banks 882
The mosquito blight of tea, H. H. Mann 882
Preliminary experiments in dipping nursery stock, F. W. Faurot 882
Michigan laws for the protection of orchards and vineyards 883
Spraying mixtures and machinery, F. L. Stevens and R. S. Woglum 883
Fumigation with hydrocyanic-acid gas 883
Paris green, R. Harcourt 883
Alimentary canal of the mosquito, M. T. Thompson 883
Studies on mosquitoes, B. Galli-Valerio and Jeanne Rochaz-De Jongh 883
Logical basis of sanitary policy of mosquito reduction, R. Ross 884
The cattle tick, A. Löfgren 884
The cattle tick in Washington and Benton counties, W. G. Vincenheller 884
Beekeeping: Its pleasures and profits, J. B. Paige 884
Fourth annual report of Illinois State Bee-Keepers' Association 885

Page.
The rearing of queen bees, E. F. Phillips 885
The enemies of bees, A. Gale 885
Treatise on the silkworm and mulberry, E. Maillot and F. Lambert 885
A new flagellate parasite of the silkworm, C. Levaditi 885

FOODS—HUMAN NUTRITION.

Influence of cooking upon nutritive value of meats, H. S. Grindley and A. D. Emmett 886
Study of phosphorus content of flesh, A. D. Emmett and H. S. Grindley 887
Artificial digestion experiments, E. Gudeman 887
Folin's theory of proteid metabolism, D. N. Paton 888
Strength and diet, R. Russell 888
Cooking by cold: Some studies, E. Cutter 888
Effects of high external temperatures on body temperature, respiration, and circulation in man, A. E. Boycott and J. S. Haldane 888
Rice flour sold in France 889
Carbohydrates of marine algæ and products, J. König and J. Bettels 889
Barley grits and pearl barley from sulphured grain, T. Wetzke 889
Cheese as an article of diet. Fancy cheeses, J. G. McMillan 889
Tannin in coffee, C. D. Howard 889
Chemical and sanitary studies of oils used as food, F. Ludwig 889
Condiments and their active principle, P. Martens 889
Experiments in blanching vegetables, T. Zschokke 889
Results of examination of canned vegetables, O. Schütte 890
Report on food products for 1905, B. W. Kilgore 890
Report of food and drug inspection, C. D. Howard 890
The fate of boric acid in the body, E. Rost 891
The necessity for a national pure-food law, E. Girard 891
Foods and food control, W. D. Bigelow 891

ANIMAL PRODUCTION.

Licensed commercial feeding stuffs, 1905, F. W. Woll and G. A. Olson 891
Inspection of feeding stuffs in Wisconsin and some results, F. W. Woll 892
Foods for live stock 892
Barley, F. Barnstein 892
Digestion experiments, W. P. Gamble 892
Digestibility of cotton-seed meal and dried yeast residue, F. Honcamp et al 893
Comparative digestibility of hay and straw by cattle and sheep, O. Kellner et al 893
Digestibility of materials used to absorb molasses, T. Pfeiffer and A. Einecke 893
Spontaneous combustion of hay, K. H. M. van der Zande 893
Contents of lime and phosphoric acid in feed rations, S. Hals 894
Experiments in calf feeding 894
Utilization of skim milk for calf feeding, A. Pirocchi 894
Cattle feeding 894
Experiments in steer feeding, J. A. Craig and F. R. Marshall 894
Silage, hay and stover in beef making, A. M. Soule and J. R. Fain 895
Draft cattle, M. Ringelmann 896
Sheep feeding experiments, W. Bruce 896
Live stock, G. E. Day 896
Pig feeding experiments, C. L. Beach and H. L. Garrigus 896
Fattening pigs and wintering brood sows on alfalfa and grain ration, H. R. Smith 897
Experiments on rational feeding of army horses, H. van de Venne 898
Influence of crushing on digestibility of oats, L. Grandeau 898
Report of manager of the poultry department, W. R. Graham 898
Artificial incubation, E. Brown 899
Hints to poultry raisers, G. A. Bell 899
Marketing of poultry products, F. H. Stoneburn 899
Poultry and pigeon-squab combination, M. K. Boyer 899
Breeding wood ducks, S. D. Talbot 899
Raising guinea fowls, Jennie O'Connor 899

DAIRY FARMING—DAIRYING—AGROTECHNY.

	Page.
Gluten and cotton-seed meal for cows, A. M. Soule and J. R. Fain	900
Dried beet pulp as a substitute for corn silage, G. A. Billings	900
Alfalfa hay *v.* purchased feeds, G. A. Billings	900
Forage and soiling experiments, 1904, G. C. Watson and T. I. Mairs	901
Feeding experiments with milch cows, J. Hansen	901
Experiments on feeding dairy cows, C. B. Jones	901
Contributions to the manner of conducting practical feeding experiments with milch cows, A. Ostermayer	902
Influence of feeding stuffs on milk and milk products, A. Burr	902
Dairy cow demonstration of Louisiana Purchase Exposition, E. H. Farrington	902
Official tests of dairy cows, 1904–5, F. W. Woll	903
Report of the professor of dairy husbandry, H. H. Dean	903
The milk scales, the milk sheet, and the Babcock test, B. H. Rawl	905
The chemical composition of colostrum, E. Winterstein and E. Strickler	905
Taint in milk due to contamination by copper, J. Golding and E. Feilmann	905
Fat content of separator slime, P. Gordan	906
Milk and butter preservatives, R. Harcourt	906
Investigations on the preservation of milk samples, M. Siegfeld	906
The adulteration of butter, C. Simmonds	906
Some factors that control water content of butter, F. T. Shutt et al	906
Constituents of Emmenthal cheese, E. Winterstein and W. Bissegger	906
Presence of acid and rennet producing bacteria in ripening cheese, C. Gorini	907
Classification of the bacteria of milk, A. Rodella	907
Causes of "blowing" in tins of condensed milk, G. H. Pethybridge	907
Investigations and progress of the manufacture of sugar, J. Bock	907
The manufacture of cane sirup, B. B. Ross	907
Experiments with fermentation of fruit juices, G. Knudsen	908
Chemical processes in wine making, K. Windisch	908
The spinning and twisting of long vegetable fibers, H. R. Carter	908

VETERINARY MEDICINE.

Division of veterinary science, J. A. Gilruth	908
Reports of inspectors of stock for year ended March 31, 1905, E. Clifton et al	909
Diseases of the bone and phosphates in the feed, L. Grandeau	909
Comparative study of different forms of tuberculosis, S. Arloing	909
Studies on tuberculosis, II, A. Köppen	909
A struggle with tuberculosis in domestic animals, E. Ujhelyi	909
Von Behring's method of immunization of young cattle, C. Guérin	910
Properties of local toxins of tubercle bacillus, P. Armand-Delille and Huet	910
Properties of fatty acids in tubercle bacilli, J. Camus and P. Pagniez	910
Experimental transmission of tuberculosis to anthropoid apes, von Dungern	910
Tuberculous spondylitis in cows, O. Stenström	910
Milk fever, its causes, symptoms, and successful treatment, J. Spencer	910
Parturient paresis, puerperal septicemia, and paralysis after parturition, E. Hess	911
Treatment of appearance of blood or hemoglobin in the milk, K. Meuch	911
Infectious vaginal catarrh of cattle, Thoms	911
Sterility in milch cows, its cause and treatment, Albrechtsen	911
Contagious abortion among cattle, A. H. Cory	912
Cowpox, Desmond	912
Eradication of African coast fever, C. E. Gray	912
The time an area remains infected with east coast fever, A. Theiler	912
Redwater in cattle and its treatment with Damholid, Westermann	912
The cause of wooden tongue, M. P. Rukhlyadev	913
A wasting disease of young cattle, L. A. Klein	913
Cattle plague in Egypt in 1903 to 1905, W. Littlewood	913
Malarial catarrhal fever (blue tongue) of sheep in South Africa, J. Spreull	913
Blue tongue in sheep, A. Theiler	914
Scab and its eradication, C. E. Gray	914
Infestation of lambs with flies, O. Jordal	914
Characterization of hog cholera group, A. Böhme	914
Heartwater and horse sickness, J. M. Coutts	914
The identity of surra and mbori, A. Laveran	915

Page

Pathological histology of experimental infection with *Trypanosoma brucei*, E. Sauerbeck 915
Immunization against tsetse-fly disease, C. Schilling 915
Trypanosomiasis in camels, A. Theiler 915
Etiology of so-called horse typhoid or petechial fever, Baruchello and Mori 915
The bacterial flora of the nasal cavity of the horse, De Angelis 916
Occurrence of the tetanus bacillus in animal feces, A. Hoffmann 916
Destruction of rabies virus in the peritoneal cavity, P. Remlinger 916
Diagnostic value of Negri's corpuscles, Bohne 916
Nonvirulence of milk of rabid herbivorous animals, J. Nicolas 916
Paralysis of the lower jaw in dogs independently of rabies, Dauphin 917
Esophageal spiropterosis in dogs in southern Tunis, Le Maitre 917
Internal mycoses and the micro-organisms which cause them, P. Savouré 917
Toxic substances produced by animal parasites, R. Blanchard 917

RURAL ENGINEERING.

Irrigation service in Upper and Lower Egypt, A. L. Webb and R. E. Verschoyle 917
Typical examples of sewage irrigation, P. Ehrenberg 918
Reservoirs, M. Ringelmann 918
Weir experiments, coefficients, and formulas, R. E. Horton 918
The good roads problem in Iowa 918
The use of cement for farm purposes, S. M. Woodward 919
Denaturized alcohol for farm purposes, C. J. Zintheo 919
Straw as a substitute for coal, C. Voitellier 919
The capacity of wind motors, M. Ringelmann 919
New farm machinery, B. Martiny 920
Lucerne cultivators 920
Practical cold storage, M. Cooper 920

AGRICULTURAL EDUCATION.

Report on distribution of grants for agricultural education and research 920
Agricultural instruction for adults in continental countries, J. Hamilton 922
Statistics of land-grant colleges and experiment stations, 1905, M. T. Spethmann 922
Negro agricultural and mechanical colleges, J. H. Bluford 922
Teaching agriculture in the common schools, G. Severance 922
Relation of geography to nature study in elementary school, H. W. Fairbanks 922
Studies of corn and its uses, F. H. Rankin 923
Experiments with milk and butter, J. W. Decker 923
An elementary study of soil, A. B. Graham 923
Window gardening in the schoolroom, H. B. Dorner 923

MISCELLANEOUS.

Annual Reports of the Department of Agriculture, 1905 923
Eighteenth Annual Report of Alabama College Station, 1905 923
Annual Report of Connecticut State Station, 1905 923
Eighteenth Annual Report of New York Cornell Station, 1905 924
Director's Report for 1905, W. H. Jordan 924
Eighteenth Annual Report of Rhode Island Station, 1905 924
Annual Report of Virginia Station, 1905 924
Crop Reporter 924

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Alabama College Station: Page.
Bul. 133, Dec., 1905 ... 907
Eighteenth An. Rpt., 1905 ... 923
Alabama Tuskegee Station:
Bul. 8, Jan., 1906 ... 856
Alaska Stations:
Bul. 2, Nov. 15, 1905 (5 cents) ... 863
Arkansas Station:
Bul. 89, 1906 ... 858
Bul. 90, 1906 ... 884
Colorado Station:
Bul. 106, Dec., 1905 ... 864
Connecticut State Station:
Bul. 152, Jan., 1906 ... 857
An. Rpt., 1905, pt. 1 ... 846, 923
Connecticut Storrs St tion:
Bul. 38, Jan., 1906 ... 899
Bul. 39, Jan., 1906 ... 896
Illinois Station:
Circ. 101, Jan., 1906 ... 857
Indiana Station:
Bul. 110, Jan., 1906 ... 857
Massachusetts Station:
Met. Buls., 205–206, Jan.–Feb., 1906 ... 835
Missouri Fruit Station:
Bul. 13, Dec., 1905 ... 846
Bul. 14, Jan., 1906 ... 882
New Jersey Stations:
Bul. 188, Nov. 29, 1905 ... 846
Bul. 189, Dec. 6, 1905 ... 900
Bul. 190, Dec. 20, 1905 ... 856, 900
Bul. 191, Dec. 30, 1905 ... 864
New York Cornell Station: Page.
Eighteenth An. Rpt., 1905 ... 924
New York State Station:
Bul. 269 (popular ed.), Oct., 1905 ... 865
Bul. 272, Dec., 1905 ... 847
Bul. 273, Dec., 1905 ... 880, 881
Bul. 274, Dec., 1905 ... 924
North Carolina Station:
Bul. 193, Feb., 1906 ... 883
Pennsylvania Station:
Bul. 75, Dec., 1905 ... 901
Rhode Island Station:
Eighteenth An. Rpt., 1905 ... 835, 842, 844, 847, 858, 861, 880, 924
South Carolina Station:
Bul. 95, Mar., 1905 ... 905
Bul. 109, May, 1905 ... 865
Bul. 114, May, 1905 ... 913
Texas Station:
Bul. 76, Nov., 1904 ... 894
Virginia Station:
Bul. 154, Apr., 1905 ... 857
Bul. 155, May, 1905 ... 836, 864
Bul. 156, July, 1905 ... 900
Bul. 157, Sept., 1905 ... 895
Bul. 158, Nov., 1905 ... 910
Bul. 159, Jan., 1906 ... 843
An. Rpt., 1905 ... 854, 924
Wisconsin Station:
Bul. 130, Dec., 1905 ... 891, 892
Bul. 131, Dec., 1905 ... 903

Circ. 64 ... 922

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, Ph. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. Beal.
Agricultural Botany and Vegetable Pathology—W. H. Evans, Ph. D.
Field Crops—J. I. Schulte.
Horticulture and Forestry—C. B. Smith.
Zootechny and Human Nutrition—C. F. Langworthy, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. Lawson.
Agricultural Chemistry—W. H. Beal, C. F. Langworthy, and H. W. Lawson.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. Wilcox, Ph. D.
Rural Engineering—R. P. Teele.
Rural Economics—H. C. Taylor, Ph. D.
Agricultural Education—D. J. Crosby.

CONTENTS OF VOL. XVII, NO. 10.

Page.

Editorial notes: A conception of agricultural research 929
Recent work in agricultural science 934
Notes 1025

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Determination of available plant food in soil, A. D. Hall and A. Amos 934
Determination of phosphoric acid, G. Jörgensen 934
Citrate solubility of phosphoric acid in fertilizers, J. K. S. Dixon 935
Determination of phosphoric acid in Thomas slag, bone meal, etc., O. Böttcher 936
Analytical notes on the superphosphate industry, L. Schucht 936
Use of Heraeus electric crucible in analysis of phosphates, F. Haussding 936
The industrial analysis of water, E. Bosch 936
Determination of nitrous acid in water analysis, G. Lunge 936
Separation of solutes from solvents, F. K. Cameron and J. M. Bell 937
Chemistry of the proteids, G. Mann 937
Guide for the examination and analysis of milk, A. Farines 937
Experiments with the "sin-acid" butyrometer, J. Adorján 937
Rapid analysis of butter, H. W. Charlton 938
Silver indexes for detection of cocoanut oil in butter, F. Jean 938
Microscopy of vegetable foods and condiments, J. Moeller 938
Quantitative estimation of the lecithans, W. Koch and H. S. Woods 938
Identification of horse and colt flesh, M. Martin 938
Sulphate and sulphur determinations, O. Folin 938
Bluestone and formalin, T. Macfarlane 938
Interpretations of chemical analyses for farmers, H. Ingle 939
Agricultural chemistry during second half of 1905, W. Zielstorff 939
Thirteenth annual report of committee on atomic weights, F. W. Clarke 939

METEOROLOGY—WATER.

	Page.
Outlines of tropical climatology, G. M. Giles	939
Monthly Weather Review, Vol. XXXIII, Nos. 12, 13	939
Summary of meteorological observations, January to June, 1904, F. H. Loud	940
Number of hours of possible sunshine at Colorado Springs, F. H. Loud	940
Meteorology for the year 1905, J. Derôme	940
Meteorological summary for 1905, H. Dufour and D. Valet	940
Practical meteorological studies and comparative observations, G. Eiffel	940
Meteorological observations, G. Ginestous	940
Meteorological Chart of the Great Lakes, A. J. Henry and N. B. Conger	941
Climate of the Pacific coast, A. McAdie	941
The climate of Madison, Wis., J. L. Bartlett	941
A first report on the relations between climates and crops, C. Abbe	942
Weather forecast, D. E. Hutchins	942
The atmosphere, G. Bleuel	943
Water, A. Hebebrand	943
A method of determining the turbidity of water, J. F. Liverseege	943
Wartha method for determining hardness in water, H. Sichling	943
Notes on investigations relating to rain water, H. M. Knipscheer	943
Disappearance of water from the upper layers of the soil, W. Götz	943
Influence of forests on underground waters, M. Ringelmann	943
The drinking-water question	943
The hygienic rôle of germs in water, F. Malméjac	943
Present status of waste-water purification by biological methods, Thumm	943
Effect of copper sulphate on bacteriological and chemical constituents of large bodies of water, W. R. Stokes and J. B. Thomas	944

SOILS—FERTILIZERS.

Renovation of worn-out soils, W. J. Spillman	944
Present definitions of soil fertility, W. H. Jordan	944
The analysis of soils, E. A. Mann	944
Fertility studies on Wooster soil, A. H. Snyder and C. L. Cook	944
Fertility studies on Strongsville soil, A. H. Snyder and C. L. Cook	945
Rubber soils, H. N. Ridley	946
"Soluble" phosphoric acid and its movements in soil, W. Hoffmeister	946
The removal of soluble salts from soils, M. Ringelmann	947
Progressive changes in soil moisture, W. Götz	947
Underground studies, C. Ochsenius	947
Soil physics laboratory guide, W. H. Stevenson and I. O. Schaub	947
Economic geology of the United States, H. Ries	947
Nitrification of nitrogenous matter in the soil, G. Masoni	947
Nitrification of some organic fertilizers, Guillin	948
Importance of nitrification for cultivated plants, W. Krüger	948
Influence of fertilizing and of plant growth on soil, W. Krüger	949
Fixation of atmospheric nitrogen by plants, Trabut	949
Utilization of atmospheric nitrogen by means of micro-organisms, R. Thiele	949
Assimilation of free elementary nitrogen by micro-organisms, J. Vogel	950
Nitrogen-fixing bacteria, T. W. Kirk	950
Experiments with nodule-forming bacteria, F. C. Harrison and B. Barlow	950
Tests of commercial cultures of nitrogen-fixing bacteria	950
Fertilizing value of atmospheric nitrogen preparations, M. Hoffman	951
Some experiments with lime nitrogen on mineral and moor soils and investigations on decomposition of calcium cyanamid in various kinds of soil, H. von Feilitzen	951
Barnyard manure, A. Vivien	951
Litter and nitrogen, R. Hornberger	951
Crude ammonia, Guerrapain	951
Crude ammonia, A. Grau	952
Analysis of nitrate of soda, R. Bensemann	952
Acid versus basic phosphatic fertilizers, W. F. Sutherst	952
Fertilizing action of certain accessory compounds in slags, Guffroy et al	952
Comparative experiments with high and low percentage Thomas slag	953
Citric-acid soluble phosphoric acid in slag, M. de Molinari and O. Ligot	953

Page.
Phosphate mining in Tennessee, D. S. Cooke 953
Algerian phosphate and apatite 953
Assimilation of potash and soda by plants, T. Pfeiffer et al 953
Manuring with potash salts, C. Dusserre 954
Kainit, L. Bargeron 954
A molasses-potash fertilizer, O. Reitmair 954
Successful use of manganese as a fertilizer, G. Bertrand 954
Recovery of products of commercial value from sewage sludge, J. Grossmann 955
Plant analysis in estimating manurial requirements, P. Schneider 955
Analysis of commercial fertilizers sold in Maryland, H. B. McDonnell et al 955
Inspection of fertilizers in 1905, F. W. Morse et al 955

AGRICULTURAL BOTANY.

Calcium as a plant nutrient, V. V. Yermakov 955
Regeneration in plants, W. B. McCallum 956
Rôle of albuminoid substances of leaves, N. I. Vasilyev 956
Anatomy of the root tubercles of some Leguminosæ, J. Bernatsky 956
Effect of self-fertilization in the Leguminosæ, O. Kirchner 957
Effect of light on *Melilotus alba*, R. W. Coppedege 957
Action of sulphur dioxid on plants, A. Wieler 957
Probable bacterial origin of gum of linseed mucilage, R. G. Smith 958
The ascent of water in trees, A. J. Ewart 958
Artificial nutrition of diseased trees, S. A. Mokrzhetski 959
Investigations on the starch and fat content of fir trees, L. Fabricius 960
Reserve material of trees, Leclerc du Sablon 960
Two coast Rhizobia of Vancouver Island, B. C., A. Schneider 960
The isolation and cultivation of Rhizobia in artificial media, A. Schneider 960
The delta of the Rio Colorado, D. T. Macdougal 961
Poisonous plants of Indiana, S. Coulter 961

FIELD CROPS.

Results obtained in 1905, W. and C. E. Saunders 961
[Field crop work], E. Clifton et al 963
Annual report on experimental farms in Bombay Presidency, 1905 963
Department of cooperative experiments, L. H. Goddard and M. O. Bugby 963
Partial statement of tests offered for 1906 963
Proposed constitution and by-laws of Ohio Plant Breeders Association 963
An example of model farming, W. J. Spillman 963
Diminishing errors in field trials, G. Holtsmark and B. R. Larsen 963
Experiments in electroculture, R. Löwenherz 963
Influence of lime nitrogen on germination, B. Schulze 964
Adulteration of Kentucky blue grass and orchard grass seed, J. Wilson 964
The value of fertilizer experiments on meadows, T. Remy 964
The rate of seeding grass seeds, O. Glaerum 964
Influence of precipitation and temperature on yield, G. Holtsmark 964
Effect of time of cutting on hay, S. Hals 965
The protein content of barley and potash manuring, O. Reitmair 965
Use of whole and halved fodder beets in seed production, H. Briem 965
Corn culture, J. F. Duggar 965
Iowa's immature corn, C. Reinbott 966
Effect of dilute hydrochloric acid upon corn seedlings, F. A. Loew 966
Cotton growing in Australia, J. Bottomley 967
Cooperative potato experiments, 1904, M. Weibull et al 967
Cooperative potato experiments, 1904, H. Juhlin-Dannfelt and S. Rhodin 967
The sprouting of seed potatoes, R. B. Greig 967
Aerial tubers of the potato, P. de Vilmorin 968
Improvement of common varieties of rye in lower Austria, G. Pammer 968
Saccharine sorghums for forage, C. R. Ball 968
The culture of the sugar beet, G. W. Shaw 969
Experiments with sugar beet, G. Clarke 969
Evaporation by the sugar cane plant, Z. Kamerling 969
Third annual convention of Interstate Sugar Cane Growers Association 969
Notes concerning seed wheat, G. W. Shaw 969

HORTICULTURE.

	Page
The farmer's vegetable garden, J. D. Lloyd	969
Vegetable growing	970
Quality of vegetables and fruits for home garden, L. and Effie M. Barron and S. W. Fletcher	970
Planting tables for flowers and vegetables	970
Classified planting list for annuals and vegetables, P. T. Barnes	970
Fifty dollars per acre from cucumbers, W. C. Collins	970
Breeding sweet corn—cooperative tests, B. D. Halsted	970
Results of experiments with mushrooms, F. Canning	971
Canning fruit and vegetables. Preserving fruit juices, E. F. Pernot	971
Small canneries in Virginia, R. H. Price	972
Report of fruit experiment stations of Ontario, 1905, L. Woolverton et al	972
Fruits recommended for planting in Ontario	972
Fruit cultivation in Ceylon, H. F. Macmillan	972
Experiments in orchard culture, W. M. Munson	972
Suggestions upon the care of apple orchards, E. Walker	973
The Spencer seedless apple	974
Experience with plums, H. T. Thompson	975
Orange culture	975
Orange hybrids	975
Studies on the banana, L. B. Mendel and E. M. Bailey	975
The Indian jujube	975
The experiment in cocoa curing on the Gold Coast	975
Report of horticultural and viticultural expert, A. Despeissis	975
Influence of graft on quality of grapes and wine, Curtel and A. Jurie	976
The Lincepina grape, M. B. White	976
The production of oil of wintergreen, H. D. Foster	976
Pruning, training, and trimming trees and shrubs, D. G. McIver	976
The book of the winter garden, D. S. Fish	976
The lawn, L. C. Corbett	976
Study of bibliography and horticultural literature of the past, G. Gibault	976

FORESTRY.

The tree book, Julia E. Rogers	977
The forest service, G. Pinchot	977
Working plan for forest lands in central Alabama, F. W. Reed	977
Forestry in Nova Scotia, K. W. Woodward	978
Forestry and forest products of Japan	978
Weight and shrinkage of Japanese woods, K. Moroto	978
Beginning of lumbering as an industry in the new world, J. E. Hobbs	978
The rise in lumber prices, R. S. Kellogg	978
The use of wood pulp for paper making, S. C. Philipps	978
A new saving in the turpentine industry	979
Laws relative to the taxation of forest lands	979
Efficient fire protection, A. B. Recknagel	979
Results of a Rocky Mountain forest fire, W. J. Gardner	979
Influence of forests on the ground-water table, A. Bühler	979
Rubber, gutta-percha, and balata, F. Clouth	980
Rubber tapping on Kepitigalla Estate, I. Etherington	980
A new tapping method for *Kickxia elastica*, Strunk	980
Experimental tapping of Para rubber trees, H. N. Ridley and R. Derry	980
Note on the germination of teak and other seed, R. S. Pearson	981
The teak-timber trade of Burma, T. A. Hauxwell	981

DISEASES OF PLANTS.

The physiology of diseased plants, L. Montemartini	981
Plant diseases of Belgium, H. Vanderyst	981
Annual report of investigations on plant diseases, M. Hollrung et al	982
Bearing of Mendelism on the susceptibility of wheat to rust, E. J. Butler	982
Experiments with wheat and oats for smut, L. F. Henderson	982
The flag smut of wheat, D. McAlpine	982
Potato scab, L. F. Henderson	982
Potato leaf curl, M. C. Cooke	983
Cytolytic enzym produced by *Bacillus carotovorus*, L. R. Jones	983

Page.
Cactus scab, G. Massee 983
Constitutional diseases of fruit trees, A. G. Campbell 984
Black spot canker and black spot apple rot, W. H. Lawrence 984
Pear blight, cause and prevention, R. I. Smith 984
A new disease of olives, A. Maublanc 985
Some causes of the destruction of vines in Tunis, L. Ravaz 985
Studies on the gray rot of grapes, G. de Istvánffi 985
Experiments in controlling black rot in Loire, L. Rougier 986
A new disease of grapes, G. de Istvánffi 986
The bud rot of cocoanuts, J. H. Hart 986
Cacao diseases 986
The cocoa disease in Surinam 987
The silver leaf disease 987
Combating the pine leaf cast, Schalk 987
Winter treatment against fungus diseases, L. Degrully 987
Fungicides and use in preventing diseases of fruits, M. B. Waite 987

ENTOMOLOGY.

Proceedings of the Entomological Society of Washington 988
Report of Entomological Society of Canada 988
Report of State entomologist of Minnesota, 1905, F. L. Washburn 988
Diptera of Minnesota, F. L. Washburn 989
Report on economic zoology, F. V. Theobald 989
Report on injurious insects and plant diseases for 1904, W. M. Schøyen 989
Injurious insects, F. Corboz 989
The entomological section, L. Bostock and C. B. Simpson 989
Entomological investigations in central Asia, J. Sahlberg 989
Insects of the garden, R. H. Pettit 990
Chief insect enemies of garden crops, I. Vasilev 990
Insects injurious to Indian corn, II, S. A. Forbes 990
Root maggots and how to control them, F. H. Chittenden 990
Injurious bugs and cicadas on cotton, T. Kuhlgatz 991
The boll weevil and cotton crop of Texas, E. D. Sanderson 991
The remedy for the boll weevil, W. Newell 991
Control of codling moth and apple scab, C. L. Marlatt and W. A. Orton 991
Practical suggestions for codling moth control in Pajaro Valley, W. H. Volck 991
The gypsy moth in New Hampshire, E. D. Sanderson 992
The brown-tail moth in New Hampshire, E. D. Sanderson 992
The gypsy moth and the brown-tail moth, W. E. Britton 992
Some experiences with insecticides for San José scale, C. O. Houghton 992
The San José scale, W. Newell 992
Spraying for the San José scale, J. S. Houser 993
San José scale, A. B. Cordley 993
Acariosis of grapes, H. Faes 993
Strawberry crown girdler, Edith M. Patch 994
Caterpillars on oaks, C. W. Woodworth 994
Dust and liquid spraying, C. P. Close 994
The K.-L. emulsions and spraying, C. P. Close 995
Insects and insecticides 995
Annual report of royal sericultural station, Padua 995

FOODS—HUMAN NUTRITION.

The history of bread from prehistoric to modern times, J. Ashton 996
The varieties of bread 996
Comparative values of different grades of wheat, R. Harcourt 996
Estimating the fineness of flour, N. Wender 996
The facing of rice, C. H. Cribb and P. A. E. Richards 996
Banamine 997
Floating manna grass, C. Hartwich and G. Håkanson 997
The losses in weight when fish flesh is dried, F. Peters 997
Composition of unripe and canned peas, H. Frerichs and G. Rodenberg 997
Jams, marmalades, and jellies, A. McGill 997
Olive oil, A. McGill 997
A honey substitute, G. Reiss 997

Page.
New honey surrogates, A. Beythien 997
Highly colored confectionery, T. Macfarlane 998
Concerning spices. I, Pepper and cinnamon, H. Lührig and R. Thamm 998
Ground pepper, A. McGill 998
Peppers, T. Macfarlane 998
Tincture of ginger, A. McGill 998
Vinegar, A. McGill 998
Cream of tartar, A. McGill 998
German food book 998
The value of fruit and vegetables in the diet, M. Rubner 998
Distinctive features of animal and vegetable dietaries, L. B. Mendel 998
Climate and health in hot countries, G. M. Giles 999
The provisioning of the modern army in the field, H. G. Sharpe 999
Field cookery, M. Ringelmann 999
Self-cooker, G. H. Murphy 999
The digestibility of evaporated cream, T. Mojonnier 999
Influence of diet on growth and nutrition, C. Watson and A. Hunter 1000
Experiments on protein and mineral metabolism in man, G. von Wendt 1000
Replacing protein by gelatin in metabolism experiments, M. Kauffmann 1000
Experiments on effect of tea upon stomach secretions, T. Sasaki 1000
A new nitrogenous constituent of normal human urine, P. Hári 1000
Recent advances in physiology and biochemistry, edited by L. Hill 1000

ANIMAL PRODUCTION.

Destruction of foods and feeding stuffs by micro-organisms, J. König et al 1001
Spontaneous combustion of hay, F. W. J. Boekhout and J. J. O. de Vries 1001
Micro-photographs of the chaff of Gramineæ, H. Neubauer 1001
Phosphate of lime in the feeding of farm animals, L. Grandeau 1001
Energy value of red clover hay and corn meal, H. P. Armsby and J. A. Fries 1001
Amount of saliva secreted and relation to feed, A. Scheunert and G. Illing 1001
Adaptation of salivary secretion to diet, C. H. Neilson and O. P. Terry 1001
Studies on the digestion of herbivorous animals, P. Bergman 1002
Digestive processes in horses on maize, A. Scheunert and W. Grimmer 1002
The rational feeding of farm animals by syndicates, Kohler 1002
Production and feeding of cattle, horses, asses, and mules, P. Diffloth 1002
Sheep, goats, and pigs, P. Diffloth 1002
Cattle feeding experiment, W. Bruce 1003
Feeding broken or crushed bones to cattle, D. Hutcheon 1003
Mechanical work performed by Limousin cattle, Ringelmann 1003
Tests of the strength of oxen 1003
Theoretical and practical calf feeding, M. Rasquin 1003
Steam-cooked milk for calves, Bugge 1004
Pig feeding experiments with sugar-beet chips, Klein 1004
Twenty years' experiments on work horses, L. Grandeau and A. Alekan 1004
Barley for horses, P. Van Biervliet 1004
Poultry raising, C. Voitellier 1004
Poultry houses and fixtures 1004
Races of domestic poultry, E. Brown 1004
Poultry division, D. D. Hyde 1004
The year's work in poultry, D. F. Laurie 1004
How frequently does the setting hen turn her eggs? H. F. Prince 1005

DAIRY FARMING—DAIRYING.

Dairy investigations in northeast of England, D. A. Gilchrist and C. B. Jones 1005
Milk investigations at Garforth, 1905, C. Crowther 1005
Milk records, J. Speir 1005
Influence of asparagin on milk production, T. Pfeiffer 1005
Feeding dairy cows, C. D. Smith 1005
Is the passage of food fat into milk demonstrable? S. Gogitidse 1005
On the Baudouin reaction in human milk fat, Engel 1006
Purity of Raleigh's milk supply, F. L. Stevens 1006
Milk treated with hydrogen peroxid, P. Adam 1006
Action of formalin and hydrogen peroxid on milk, P. Bandini 1006
Methods of preserving milk, P. Vieth 1006

Page.
Preservation of milk with hydrogen peroxid, Eichholz 1006
Preservation of milk before skimming, L. Marcas and C. Huyge 1007
Action of the ultra-violet rays on milk, N. Gerber and A. Hirschi 1007
The significance of streptococci in milk, P. G. Heinemann 1007
Streptococci and leucocytes in milk, W. G. Savage 1007
The leucocyte test of milk, R. Trommsdorff 1007
The Trommsdorff leucocyte test for milk, W. Rullmann 1008
Chemical composition of colostrum with especial reference to proteids, E. Winterstein and E. Strickler 1008
Sodium chlorid in milk, C. Porcher 1008
Comparative study of milk tests, C. Huyge 1008
Distribution of lactic ferments outside the milk, C. Barthel 1008
A municipal milk service for London, L. Parkes 1008
Cleansing of milk vessels: Relative value of washing powders, A. H. Stewart. 1009
The examination of pasteurized milk, P. Buttenberg 1009
Pasteurization of cream in butter making, J. Arthaud-Berthet et al 1009
Protest against slandering American butter, G. L. McKay 1009
Red-spotted butter, H. Stadlinger and J. Poda 1010
Strictly anærobic putrefactive bacteria in cheese ripening, A. Rodella 1010
Influence of fat content of milk on Emmenthal cheese, O. Jensen 1010
Influence of cooking on Emmenthal cheese, O. Jensen 1010
Roquefort cheese, E. Marre 1010

VETERINARY MEDICINE.

Comparative anatomy of domesticated animals, A. Chauveau 1010
Comparative pathology of the blood, P. Meier 1010
Tumors and tumor-like lesions in the esophagus, A. W. Mörkeberg 1011
The animal parasites of man, M. Braun, trans. by Pauline Falcke 1011
Micro-organisms with spiral bodies, R. Blanchard 1011
Control of contagious diseases of animals, L. Hubert 1011
Report of the State veterinarian, L. Pearson 1011
Report of the chief of the cattle bureau, A. Peters 1011
Report on the Austrian Veterinary Service for 1901 1012
Poisoning of horses, cattle, and pigs with beans, C. Dammann and M. Behrens. 1012
Castration of females and animals other than the horse, W. Robertson 1012
Experiments in serum therapy, J. Bridré et al 1012
Comparative study of human and animal tuberculosis, H. Kossel 1012
Tuberculosis, W. P. McCray 1012
Uterine and ovarian tuberculosis in cattle, H. Fischer 1012
Tuberculous nature of diffuse enteritis in cattle, Lienaux and Van Den Eeckhaut 1013
Three years' experience in protective vaccination of cattle, Strelinger 1013
Vaccination against tuberculosis, Degive et al 1013
The sugar-producing action of the tubercle bacillus, C. Fermi 1013
A species of actinomyces, E. Haass 1013
The diagnosis of anthrax by means of cultures, Fischoeder 1014
The resistance of granulations to anthrax, R. Giani 1014
The properties of the antianthrax serum of Sclavo, E. Cler 1014
Cultural characters of the blackleg bacillus, T. Smith 1014
Report on the preparation of rinderpest protective serum, A. Lingard 1014
Specific papular stomatitis of cattle, R. Ostertag and Bugge 1014
Abortion in cattle, W. Robertson 1015
Report of Swiss Veterinary Society on granular contagious vaginitis, E. Hess. 1015
A bacilliform piroplasmosis of cattle, E. Ducloux 1015
Jensen's polyvalent serum for infectious diarrhea of calves, J. Jansson 1015
Disinfection of cattle cars with aqueous solutions of formaldehyde, J. Schmurer. 1016
Diseases of lambs, T. W. Cave 1016
Sheep pox on the Schönau estate near Leipsic, Noack 1016
Experimental myasis in goats, with study of life cycle of fly used in experiment and list of some similar noxious Diptera, F. C. Wellman 1016
The control of swine plague, Foth 1016
Health factors in horse management, S. S. Cameron 1016
Loss of horses in Kansas, F. S. Schoenleber 1016
Pathogenesis and transmissability of latent glanders, A. Bonome 1016
Etiology of pneumonia in horses, Lorenz 1017

Page.
Observations on the blood of horses infected with tetanus, M. E. Tabusso 1017
Treatment of tetanus in race horses, Chapard 1017
Nodules in the mucous membrane of the stomach in horses, A. Tomiolo 1017
Spirillosis in the horse in French Guinea, G. Martin 1017
Cilia and transverse divisions in the spirillum of fowls, A. Borrel 1018
Preventive vaccination against distemper of dogs, Meis 1018
Piorkowski's serum for dog distemper, Lange 1018
Is rabies infectious during the incubation stage? W. Koppitz 1018
Transmission of rabies through superficial wounds, V. Galtier 1018
Rabies in rats, B. Galli-Valerio 1018
The relation between fowl plague and rabies, W. Rosenthal 1018
Prosthogonimus cuneatus in hens' eggs, K. Wolffhügel 1018

RURAL ENGINEERING.

Irrigation on the farm, A. S. Kenyon 1019
The irrigation of La Campine, T. Lebens 1019
Notes on irrigation in South Africa, C. D. H. Braine 1019
The work of the hydrographic branch of the Geological Survey 1019
The work of the Reclamation Service of the Geological Survey 1019
Contributions to the study of drainage, E. Risler and G. Wery 1019
Sedimentation: Its relation to drainage, J. W. Dappert 1020
Proceedings of the Second Annual Iowa State Drainage Convention 1020
Third report on the highways of Maryland, A. N. Johnson 1020
Building the new barn, A. P. Ketchen 1020
Machinery in agriculture, Stange 1020
A gasoline-motor-propelled roller 1021
Producer gas and gas producers 1021

AGRICULTURAL EDUCATION.

Second International Congress of Agricultural Education 1021
What a university farm is for, L. H. Bailey 1022
The prospect for education in horticulture, L. H. Bailey 1022
Farmers' institutes 1022
Why friends of agricultural progress believe that agriculture should and will be taught in public schools, A. C. True 1022
Agriculture in the common schools, J. H. Bluford 1022
Elementary agriculture, A. B. Graham 1022
Teaching of agriculture in public schools, T. L. Lyon 1022
Advisability of agricultural education in elementary schools, L. H. Bailey 1023
Hints and helps for young gardeners, H. D. Hemenway 1023
A course in nature study, F. L. Stevens and Mrs. F. L. Stevens 1023
How to teach the nature-study course, J. Dearness 1023
Nature study with common things, M. H. Carter 1023

MISCELLANEOUS.

Experiment Station Work, XXXIII 1024
The sanitation of a country house, H. B. Bashore 1024
Farm hygiene, P. Regnard and P. Portier 1024
Accessions to the Department Library, 1905 1024

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

	Page.
Alabama College Station:	
Bul. 134, Dec., 1905	965
Arkansas Station:	
Bul. 91, 1906	973
California Station:	
Circ. 13, Mar., 1905	969
Circ. 14, Mar., 1905	971
Circ. 15, Aug., 1905	1022
Circ. 16, Nov., 1905	969
Circ. 17, Jan., 1906	1022
Circ. 18, Feb., 1906	944
Connecticut State Station:	
Bul. 153, Mar., 1906	992
Delaware Station:	
Bul. 72, Jan. 20, 1906	994
Bul. 73, Feb. 1, 1906	995
Bul. 74, Mar. 1, 1906	992
Idaho Station:	
Bul. 52, Jan., 1906	982
Bul. 53, Jan., 1906	982
Illinois Station:	
Bul. 105, Feb., 1906	969
Maine Station:	
Bul. 122, Dec., 1905	972
Bul. 123, Dec., 1905	994
Michigan Station:	
Bul. 233, Dec., 1905	990
Bul. 234, Feb., 1906	1005
Minnesota Station:	
Bul. 93, Dec., 1905	989
New Hampshire Station:	
Bul. 121, Dec., 1905	992
Bul. 122, Feb., 1906	992
Bul. 123, Feb., 1906	955
New Jersey Stations:	
Bul. 192, Mar. 2, 1906	970
Ohio Stations:	
Bul. 167, Oct., 1905	944
Bul. 168, Dec., 1905	945
Ohio Station—Continued.	
Bul. 169, Jan., 1906	993
Circ. 44, Nov. 10, 1905	1022
Circ. 45, Dec. 1, 1905	963
Circ. 46, Dec. 5, 1905	963
Circ. 47, Dec. 9, 1905	963
Oregon Station:	
Bul. 87, Jan., 1906	971
Bul. 88, Mar., 1906	993

Stations in the United States—Contd.

U. S. Department of Agriculture.

	Page.
Circ. 15	964
Circ. 16	950
Farmers' Bul. 242	963
Farmers' Bul. 243	987
Farmers' Bul. 244	1024
Farmers' Bul. 245	944
Farmers' Bul. 246	968
Farmers' Bul. 247	991
Farmers' Bul. 248	976
Bureau of Entomology:	
Circ. 63 (second ed.)	990
Forest Service:	
Bul. 68 (10 cents)	977
Circ. 36	977
Weather Bureau:	
Bul. 36 ($1.50)	942
Met. Chart Great Lakes, 1905, No. 2 (10 cents)	941
Monthly Weather Review, vol. 33, No. 12, Dec., 1905 (20 cents per number, $2 per year)	939, 941
Monthly Weather Review, vol. 33, No. 13 (20 cents)	939
Library:	
Bul. 58 (5 cents)	1024

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.
Field Crops—J. I. SCHULTE.
Horticulture and Forestry—C. B. SMITH.
Zootechny and Human Nutrition—C. F. LANGWORTHY, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. LAWSON.
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and H. W. LAWSON.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. WILCOX, Ph. D.
Rural Engineering—R. P. TEELE.
Rural Economics—H. C. TAYLOR, Ph. D.
Agricultural Education—D. J. CROSBY.

CONTENTS OF VOL. XVII, NO. 11.

Editorial notes:	Page.
Hon. H. C. Adams, deceased	1029
The agricultural appropriation act, 1906–7	1030
Inspection duties of the U. S. Department of Agriculture	1033
Recent work in agricultural science	1036
Notes	1123

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Investigation of products important in agriculture, C. Böhmer	1036
Equilibrium between bases present with phosphoric acid, A. Quartaroli	1036
Reactions of the three phosphoric acids, C. Arnold and G. Werner	1037
Compounds of pyrophosphoric acid, J. Cavalier	1037
Determination of citric-acid soluble phosphoric acid in slag, H. Fresenius	1037
Determination of phosphoric acid as phosphomolybdic anhydrid, G. Berju	1037
Determination of ammoniacal nitrogen, Scheele and von Soxhlet	1037
Simple method for determination of nitric acid in nitrates, J. T. Bornwater	1037
Need of uniform methods of titration in determination of nitrogen, B. Schulze	1037
Determination of potash by means of perchloric acid	1037
Detection and determination of chlorate in sodium nitrate, L. Grimbert	1037
Gravimetric determination of calcium, O. Brunck	1037
Determination of lime in soils, D. J. Hissink	1038
The analysis of foods, C. Margeot	1038
Immersion refractometer in food analysis, J. Hanuš and K. Chocenský	1038
Maple sirup and maple sugar investigations, C. H. Jones	1038
The examination of honey, H. Matthes and F. Mueller	1039
Concerning starch, glycogen, and cellulose, Z. H. Skraup	1039
Chemistry of the albumens, S. B. Schryver	1039
Crude gluten, F. A. Norton	1039
Determining the sulphurous acid in meat, C. Mentzel	1040

Page.
Estimation of undigested protein in feces, E. Rosenberg 1040
Concerning the composition of lecithin, M. Wintgen and O. Keller 1040
General and physiological chemistry of fats, F. Ulzer and J. Klimont 1040
Concerning the estimation of fat in oil-bearing seeds, F. Ruppel 1040
Contribution to the examination of butter, M. Siegfeld 1040
A simple method of determining fat in milk, Küttner and Ulrich 1040
Gerber's salt method, C. Beger 1041
Gravimetric determinations of total solids in milk, A. Segin 1041
On the watering of wine and milk, L. Surre 1041
Collaborative work on tannin analysis, F. H. Small 1041
Miscellaneous chemical analyses made in 1901, A. M. Peter and L. O. Beatty 1041
Miscellaneous chemical analyses made in 1902, A. M. Peter et al 1041
Miscellaneous analyses, C. H. Jones and F. M. Hollister 1041

METEOROLOGY—WATER.

Monthly Weather Review, Vol. XXXIV, Nos. 1, 2 1041
Meteorological observations 1042
Meteorological summaries for the year 1901 1042
Meteorological summaries for the year 1902 1042
Meteorological observations 1042
Meteorological observations, J. E. Ostrander and T. A. Barry 1043
Meteorological observations at Michigan Agricultural College, 1904 1043
Swedish meteorological observations, 1904, H. E. Hamburg 1043
Meteorological observations at Ploti Experiment Station, M. Svolinsky 1043
Observations at meteorological observatory of Innsbruck, 1902, W. Trabert 1043
International Meteorological Conference at Innsbruck 1043
Japanese meteorological service in Korea and China, S. T. Tamura 1043
Climatic notes on the Sahara, E. F. Gautier 1043
Texas rainfall during 1905 1044
Rainfall in the agricultural districts, G. G. Bond 1044
Relation of forests to rainfall, W. F. Hubbard 1044
Forests and rainfall in Silesia, J. Schubert 1044
Prevention of damage by frost, R. P. Skinner 1044
Cloud studies, A. W. Clayden 1044
Cloud formation in the Alpine valleys, H. von Ficker 1044
Apparatus for observing and recording storms 1044
Possible extension of the period of weather forecasts, E. B. Garriott 1045
Public water supply of Ohio 1045
Sources of water supply in Wisconsin, W. G. Kirchoffer 1045
The biology of water bacteria, E. Kohn 1045
Experiments with copper-iron sulphate for water purification at Marietta, Ohio. 1046

SOILS—FERTILIZERS.

Soils, T. Dietrich and F. Honcamp 1046
Mechanical analysis of soils, J. A. Murray 1046
A chemical study of some Oregon beaver-dam soils, C. E. Bradley 1046
Report on the soils of Dorset, J. Percival 1047
Loess soils and loess marls, Halenke, Kling, and Engels 1047
Fertilizer requirements of Hessian soils, E. Haselhoff 1047
Retention of bases by the soil, A. D. Hall and N. H. J. Miller 1048
Investigations on changes in the nitrogen of soils, F. Löhnis 1048
Report of chemical laboratory of Ploti Experiment Station, B. M. Welbel 1049
Some field notes on soil inoculation, H. N. Starnes 1049
Soil inoculation for legumes from artificial cultures, C. D. Woods and J. M. Bartlett 1050
Experiment with Moore's cultures of nitrogen-fixing bacteria, V. Peglion 1050
Nitrification of organic matter applied to soil in form of sewage, G. Masoni 1050
Experiments in nitrogen-enrichment of soils, F. T. Shutt and A. T. Charron 1050
A new nitrogenous manure, J. Hendrick 1051
Conversion of atmospheric nitrogen into nitric acid, L. Grandeau 1051
Chemistry and the world's food, R. K. Duncan 1051
Nitrogen requirements of crops, L. Grandeau 1051
Fertilizers, E. Haselhoff 1051
Commercial fertilizers, G. Roberts 1051

Page.
Fertilizer inspection, C. D. Woods and J. M. Bartlett 1051
Commercial fertilizers, J. L. Hills and C. H. Jones 1051
Commercial fertilizers, J. H. Stewart and B. H. Hite 1051
Commercial fertilizers, M. S. McDowell 1051
Artificial fertilizers; their functions and use, F. E. Lee 1051
The fertilizer industry 1052
Mineral resources of the United States, calendar year 1904, D. T. Day 1052
Fertilizer trials at Agricultural Academy of Sweden, H. G. Söderbaum 1052
Factors which influence fertilizing value of bone meal, H. G. Söderbaum 1053
Methods of using untreated rock phosphate, E. T. Meharry 1054
Manurial value of molasses residue, Lilienthal 1054
Development of the potash industry, H. Precht 1054
German potassium deposits, W. Schmidtmann 1054
Use of lime in agriculture, D. A. Gilchrist 1054
Corncobs as fertilizers and as fuel 1054
Dead leaves as a fertilizer 1054
Hog bristles as a fertilizer, E. Miège 1054
Bat guano from the Federated Malay States, W. R. Dunstan 1055
Water as a plant food, Backhaus 1055

FIELD CROPS.

The breeding of agricultural plants, C. Fruwirth 1055
Report of McNeill Branch Experiment Station for 1904, E. B. Ferris 1055
Report of field work done at the [Mississippi] station, 1904, W. R. Perkins 1056
Field crops at Sugar Experiment Station, Audubon Park, New Orleans 1056
Cereal investigations 1056
The prevention of lodging in cereals 1056
Forty-five years' continuous culture of cereals without manure, B. Skalweit 1057
Experiments carried out by East Suffolk Education Committee, T. H. Middleton 1057
Variety tests of wheat, oats, and potatoes, G. C. Watson and N. G. Miller 1057
Crops of southern France, Algeria, and Tunis, C. Riviére and H. Lecq 1058
Clark method of growing grass for hay, C. D. Woods and J. M. Bartlett 1058
The improvement of poor pastures, T. H. Middleton 1058
Range improvement, J. J. Thornber 1058
Alfalfa, T. F. Hunt et al 1059
Cooperative experiments with alfalfa, C. D. Woods and J. M. Bartlett 1059
Alfalfa and red clover, J. W. Wilson and H. G. Skinner 1059
Culture of the fodder beet in Tunis, R. Gagey 1059
Corn culture, R. J. Redding 1060
Corn improvement, J. A. Jeffery 1060
Experiment with corn, G. A. Crosthwait 1060
The germination of seed corn, J. W. T. Duvel 1060
Experiments with cotton and corn in 1905, J. F. Duggar and J. M. Richeson 1060
Cotton culture, R. J. Redding 1061
Cotton in Egypt, H. Lecomte 1062
Hardy Bermuda grass, J. Fields 1062
Preservation and storage of hops, K. von Baur-Breitenfeld 1062
The potato crop, T. H. Middleton 1062
Report on experiments with potatoes, 1905, W. Bruce and J. Porter 1063
Trial of varieties of potatoes, G. E. Adams 1063
Home-mixed fertilizers for potatoes, C. D. Woods and J. M. Bartlett 1063
Ramie and similar crops in India, G. B. De Cardo 1063
Field observations upon tolerance of sugar beet for alkali, G. W. Shaw 1063
Sugar beets in the San Joaquin Valley, G. W. Shaw 1065
Manurial experiments with sugar cane in Leeward Islands, 1904–5, D. Morris 1065
Relating to the sugar industry in Peru, T. F. Sedgwick 1065
Germination of seeds as affected by nutrient salt solutions, O. Kambersky 1065
Seed inspection, C. D. Woods and Bessie G. Tower 1066

HORTICULTURE.

Department of agriculture and horticulture, V. A. Clark 1066
Report of the horticultural department, J. Troop 1066
Fruits and vegetables, E. B. Ferris 1066

Page.
Further studies in lettuce culture, W. Stuart 1067
Fertilizer experiments in field culture of garden peas 1068
The cassaba melon 1068
Culture experiments on sewage fields of Berlin, J. Klar and O. Mende 1068
Soil sterilization, W. Stuart 1068
How to use a planting plan, I. G. Tabor 1069
Blossoming of fruit trees, I. B. Judson 1069
Winter injury of apple trees, W. Stuart 1069
Influence of stock on scion, W. Stuart 1069
Hybrids in their relation to grafting and wines 1070
Variation by grafting, G. Bonnier 1070
Study of cider apples of Sarthe, P. L. C. Cassarini and E. Poupard 1070
Olives and citrus fruits 1070
Varieties of dates of Tagant and Adrar, R. Arnaud 1071
Tropical fruits on the Florida Keys, P. J. Webster 1071
Miscellaneous fruit notes, W. Stuart 1071
Growing fall bearing strawberries, S. Cooper 1071
Transportation of fruit in refrigeration, G. H. Powell 1071
Cocoanut and its relation to production of cocoanut oil, H. S. Walker 1071
The seed grower, C. Johnson 1072

FORESTRY.

History of the lumber industry in America, J. E. Defebaugh 1073
Forestry statics, a handbook for advanced sylviculturists, H. Martin 1073
Handbook of the timber trade, L. Hufnagl 1073
Forestry problems in the United States, T. P. Ivy 1073
Future forest trees, A. H. Unwin 1073
Forestry division, K. A. Carlson 1073
Report forest department of Madras Presidency for 1904–5 1074
Notes on effects of frost on trees, L. E. Taylor 1074
Planting white pine in Vermont, L. R. Jones 1074
The catalpa tree for cross-ties 1074
The value of cultivated rubber to the manufacturer 1074
The spiral system of rubber tapping, I. Etherington 1075
Ceara rubber in Brazil (*Manihot glaziovii*), A. Moulay 1075
Sapium aucuparium in Ceylon 1075
Species of forest trees in Soudan, M. Constancia 1076
Philippine wood oils, A. M. Clover 1076

DISEASES OF PLANTS.

Incomplete experiments for 1905, L. F. Henderson 1076
Indiana plant diseases in 1905, F. D. Kern 1076
Plant diseases in Vermont in 1904, L. R. Jones and W. J. Morse 1077
Part taken by teleutospores and æcidia in distribution of maize and cereal rusts, J. C. Arthur 1077
Rust problems, H. L. Bolley and F. J. Pritchard 1077
Plant diseases, J. J. Thornber 1078
Notes on *Puccinia graminis*, J. Joannides 1078
Culture experiments with rust fungi, H. Klebahn 1078
Helminthosporium gramineum and *Pleospora trichostoma*, F. Noack 1078
Prevention of stinking smut of wheat and loose smut of oats, W. T. Swingle 1078
The smut of wheat, C. Macías 1078
Disease resistance of potatoes, W. Stuart 1078
Potato diseases and their remedies, L. R. Jones and W. J. Morse 1079
Concerning disease resistance of potatoes, L. R. Jones 1080
The potato leaf curl 1080
Sal Bordeaux for potato blight, C. D. Woods and J. M. Bartlett 1080
Further experience in asparagus rust control, R. E. Smith 1081
White rust of cabbages 1082
Tomato diseases in California, R. E. Smith 1082
A Fusarium disease of tomatoes, E. von Oven 1082
Bacterial disease of tomatoes 1082
The blight canker of apple trees, H. H. Whetzel 1083
A fungus disease of the mandarin orange, P. A. Saccardo 1083

Page.
A disease of bananas in Central America, H. Pittier de Fabrega 1084
The American gooseberry mildew, J. Eriksson 1084
Black blight in Granada, R. D. Anstead 1084
Gray blight of tea, T. Petch 1084
The bud rot of the cocoanut palm 1084
Cacao disease in Ceylon 1085
Canker of rubber, T. Petch 1085
A disease of Hevea seedlings, T. Petch 1085
Destruction of Siberian firs in Adlisberg, H. C. Schellenberg 1085
Root rot of logwood trees 1086
Some Indian forest fungi, E. J. Butler 1086
Some rose diseases, E. Foex 1086
North American salvia rusts, E. W. D. Holway 1086
A new orchid disease, G. Massee 1086
An orchid disease, H. Klitzing 1086
The action of copper salts on plants, F. Porchet and E. Chuard 1086
The adulteration of copper sulphate 1087

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Agricultural zoology, G. Guénaux 1087
Protection of birds which are beneficial to agriculture 1087
Special report on decrease of certain birds, E. H. Forbush 1088
Animal and insect pests, E. Wright 1088
Entomology with special reference to biological and economic aspects, J. W. Folsom 1088
Catalogue of publications relating to entomology 1088
Insects of the year, W. Stuart 1088
The periodical cicada in 1906, C. L. Marlatt 1089
Studies in grasshopper control, J. S. Hunter 1089
The Hessian fly, F. M. Webster 1089
Some insects affecting production of red clover seed, F. M. Webster 1089
The clover root borer, F. M. Webster 1090
Tobacco thrips and remedies to prevent "white veins," W. A. Hooker 1090
Pea and bean beetles 1090
The turnip mud-beetle, R. S. Macdougall 1090
The use of bisulphid of carbon against wireworms 1090
Report of the State nursery inspector, H. T. Fernald 1090
Control of San José scale and other dangerous insect and fungus pests, 1903–4 1091
Control of San José scale and other dangerous insect and fungus pests, 1904–5 1091
Some points in nursery inspection, E. A. Popenoe 1091
The plum curculio, F. Johnson and A. A. Girault 1091
The codling moth in Arizona, J. J. Thornber 1091
Report of committee on gypsy moth, insects, and birds, A. Pratt et al 1091
The brown-tail moth in Maine, E. F. Hitchings 1092
The goat moth and the wood leopard moth, R. S. Macdougall 1092
Woolly aphis, T. W. Kirk 1092
Leaf hoppers and their natural enemies, R. C. L. Perkins and G. W. Kirkaldy 1092
The pepper weevil, A. Meraz 1092
Habits, life history, and means of combating *Agrostis segetum*, K. Rossikov 1093
The larva of *Plodia interpunctella*, B. Wahl 1093
Parthenogenesis in *Otiorrhynchus turca*, A. A. Ssilantjew 1093
Cecidomyid forming galls or pseudocones on *Pinus longifolia*, E. P. Stebbing 1093
A new enemy of the Douglas fir, R. S. Macdougall 1093
Notes on termites with special reference to destruction of timber by *Calotermes brouni*, T. Broun 1093
Spraying apples. Relative merits of liquid and dust applications, C. S. Crandall 1093
Spraying, G. F. Warren 1094
Spray calendar 1094
Preparation of emulsions of crude petroleum, T. M. Price 1094
Fumigation of dwelling houses for vermin, C. Fuller 1094
Key to known larvæ of mosquitoes of United States, H. G. Dyar 1094
House flies, L. O. Howard 1094
Distribution of tsetse flies in French East Africa and in Kongo, A. Laveran 1094
The horse botfly 1095

Page.
Observations on the bionomics of *Auchmeromyia luteola*, F. C. Wellman 1095
Anatomy of *Boophilus annulatus*, S. R. Williams 1095
Apiculture, T. W. Kirk 1095
Beekeeping: How to meet its dangers and difficulties, B. N. Gates 1095
Scientific queen raising, A. H. W. Clarkson 1095
Ventilation of bees, Devauchelle 1095
Bees and the color of flowers, G. Bonnier 1096
Exhibit of economic entomology at Lewis and Clark Exposition, R. P. Currie. 1096

FOODS—HUMAN NUTRITION.

Standards of purity for food products 1096
Legislation regulating the sale of foods 1096
The microscopy of vegetable foods, A. L. Winton 1096
Food products, A. L. Winton et al 1097
Cereal breakfast foods, C. D. Woods and H. Snyder 1097
Food and the principles of dietetics, R. Hutchison 1097
Unpolished rice, H. S. Clubb 1097
The digestibility of flour made from legumes, M. Wintgen 1097
Preserved eggs and egg substitutes, A. Beythien and L. Waters 1097
Chemical change produced in foods, etc 1097
Preserved fruits in lacquered tins 1097
Pure British dried vegetables 1098
Occurrence of esters in bananas, F. Rothenbach and L. Eberlein 1098
Commercial extract of lemon, A. McGill 1098
Coffees without caffein, G. Bertrand 1098
Maple sugar and sirup, W. F. Hubbard 1098
Physiological studies of vegetarian diet, W. Caspari 1098
Respiration calorimeter with appliances for direct determination of oxygen, W. O. Atwater and F. G. Benedict 1098
Respiratory quotient in static work, II, A. Bornstein and A. Ott 1100
Respiratory quotient in static work, III, A. Bornstein and B. von Gartzen 1100
Alcohol, sugar, and caffein, effect upon muscular work, I. Ioteyko 1100
After effect of muscular work upon water vapor secretion, H. Wolpert and F. Peters 1100
Daily curve of water vapor excretion in man, H. Wolpert and F. Peters 1100
Creatin excretion in man, C. J. C. Van Hoogenhuyze and H. Verploegh 1100
Report of departmental committee on vagrancy, J. L. Wharton et al 1100

ANIMAL PRODUCTION.

Commercial feeding stuffs, E. H. Jenkins and A. L. Winton 1100
Commercial feeding stuffs sold in Maryland, H. B. McDonnell et al 1101
Concentrated feeding stuffs, J. P. Street, W. P. Allen, and V. J. Carberry 1101
Concentrated feeding stuffs and cotton-seed meal, B. W. Kilgore et al 1101
Commercial feeding stuffs, J. L. Hills, C. H. Jones, and F. M. Hollister 1102
Commercial feeding stuffs, J. L. Hills and C. H. Jones 1102
Olive pomace as a feeding stuff, E. Marchi 1102
Adulteration of feeding stuffs, C. Gotusso 1102
Alfalfa for growing and fattening of animals, I. D. Graham 1102
Effect of the ration on the value of the manure, J. M. Bartlett 1102
Nitrogen balance in nutrition of ruminants, A. Gouin and P. Andouard 1103
Assimilation of protein in animal body, E. Abderhalden and F. Samuely 1103
The nutritive value of amids, B. von Strusiewicz 1103
Phosphates in the ration of young animals, Rasquin 1103
Watering farm animals, P. Wery 1103
Second International Congress for Rational Feeding of Farm Animals 1103
Experiments on cattle feeding in the low countries, J. J. O. de Vries 1103
Feeding experiments with cattle, L. Bauwens 1103
Experiments on fattening calves, F. Smeyers 1103
Cost of maintenance and growth of ruminants, A. Gouin and P. Andouard 1104
Western feeds for beef production, J. G. Haney and O. H. Elling 1104
Highland cattle, J. Roberts 1104
Pigs and bacon 1104
Feeding of horses, E. Lavalard 1104
Influence of sugar upon digestibility of rations of horses, J. Alquier 1104

Page.
Toxicity of mineral matter of molasses for horses, J. Alquier 1105
Hunter-horse production in Ireland, W. J. Kennedy 1105
The poultry industry of Petaluma, California, P. H. Lawler 1105

DAIRY FARMING—DAIRYING—AGROTECHNY.

Influence of changes in feeding upon milk production, J. L. Hills 1105
Feeding trials with cows, J. L. Hills 1106
A comparison of feeding trial methods, J. L. Hills 1106
Influence of sesame feeding, Moser, Peter, and Kappeli 1106
Influence on fat content of milk of palm-nut cake, etc., T. von Szankowski 1106
Suggestions for construction of a modern dairy barn 1107
Dairying at Park Royal, 1905, E. Mathews 1107
Record of the station herd for 1904–5, J. L. Hills 1107
Variations in constituents of cows' milk during lactation, F. Prachfeld 1107
Relations of properties of blood to productive capacity of cows, E. Schultz 1107
Lecithin content of milk, W. Koch 1108
Composition of casein of human, cows', and goats' milk, E. Abderhalden and A. Schittenhelm 1108
Glycocoll content of milk proteids, E. Abderhalden and A. Hunter 1108
Comparison of udder conformation and of milk production, J. L. Hills 1108
Trial of Hegelund or Danish method of milking, J. L. Hills 1108
Economic production and distribution of clean milk, J. Roby 1109
Causes of low Reichert-Meissl numbers of Holland butter, A. J. Swaving 1109
Bacteriological examinations of butter, A. Reitz 1109
Casein as an adulterant of butter, R. Racine 1109
Composition of whey and curd during manufacture of Emmenthal cheese, G. Koestler 1109
Note on Dutch cheese, C. H. Cribb 1110
Carbonated milk, L. L. Van Slyke and A. W. Bosworth 1110
Artificial milk, R. Racine 1110
A new wine-cooling machine, F. T. Bioletti 1110
Manufacture of Samshu from *Sorghum vulgare*, E. H. Wilson 1110

VETERINARY MEDICINE.

Handbook of pathogenic micro-organisms, W. Kolle and A. Wassermann 1111
Parasites and parasitic diseases of domesticated animals, L. G. Neumann 1111
Police sanitation of animals, A. Conte 1111
Therapeutic technique, W. Schlampp 1111
Experimental studies on permeability of walls of alimentary tract of newborn animals for bacteria and proteids, A. Uffenheimer 1111
Bacillus necrophorus and economic importance, J. R. Mohler and G. B. Morse 1112
Report of the chief inspector of stock, R. E. Weir 1112
Books, memoirs, and articles on tuberculosis, Bouchez 1112
Cattle tuberculosis, H. Sessions 1112
Danger of infection with tuberculosis, E. C. Schroeder and W. E. Cotton 1112
Ingestion of tubercle bacilli killed by heat, A. Calmette and M. Breton 1113
Infectiousness of milk and meat from tuberculous animals, H. Pericaud 1113
Frequency of tuberculosis in dairies of Paris, H. Martel 1113
Lymphocyte and tubercle bacillus, J. Bartel and W. Neumann 1113
Tuberculosis of spleen in guinea pigs, C. Achard and P. Émile-Weil 1113
Experience with von Behring's method of protective vaccination, Schricker 1114
Prevention of tuberculosis in cattle, J. Wilson 1114
Anthrax, D. Lan 1114
Immunization of guinea pig and rabbit against anthrax, F. Marino 1114
Pathological anatomy of glanders, Schütz 1114
Observations on normal and rinderpest blood, F. S. H. Baldrey 1114
Redwater in cattle, A. E. Mettam 1114
Cattle tick investigation, A. Mayer 1115
The etiology of pneumonia, Rips 1115
Persistence of tetanus spores in animal organism in latent form, G. Tarozzi 1115
Infectious diarrhea of calves and liver disease of chickens, N. S. Mayo 1115
Diseases of the stomachs in ruminants, J. L. Webb 1115
Enzyms in cornstalks and their relation to cornstalk disease, T. M. Price 1115
Observations on Bilharziosis among animals in India, R. E. Montgomery 1116

Page.
Prevention of sheep pox, D. D. Garcia 1116
Dipping as a means of preventing ovine diseases, F. A. Verney 1116
Sheep botfly, E. Thoerry 1116
Some common parasites of sheep 1116
Life history of twisted wireworms, B. H. Ransom 1116
Swine plague, Schmidt 1116
Immunization against swine plague by means of bacterial extracts, J. Citron. 1117
Through what agency is *Trypanosoma evansi* carried over from one surra season to another? A. Lingard 1117
Tibarsa surra, H. T. Pease 1117
A specific serum for *Trypanosoma brucei*, F. K. Kleine and B. Möllers 1117
Action of brilliant green on trypanosomes of naganam, H. Wendelstadt and T. Fellmer 1117
Piroplasmoses, L. Panisset 1118
Piroplasmosis complicated with horse sickness, Theiler 1118
Treatment of nail pricks of the horse's foot, E. L. Moore 1118
Poisoning of horses by *Ornithogalum thyrsoides*, D. Hutcheon 1118
Examination of Western Australian poison plants, E. A. Mann 1118
The rabies corpuscles of Negri, J. Schiffmann 1118
Tapeworms of American chickens and turkeys, B. H. Ransom 1118

RURAL ENGINEERING.

Irrigation investigations 1119
Report of the reconnaissance of the Vaal River, F. A. Hurley 1119
Agriculture in the valley of the Ahr, H. Dupays and L. Lebrun 1120
Pumping machinery at Mildura 1120
A Hawaiian pumping plant for irrigation 1120
Canals and ditches, M. Ringelmann 1120
Belle Fourche dam, Belle Fourche project, South Dakota, R. F. Walter 1120
The Belle Fourche irrigation works, South Dakota, W. W. Patch 1120
The drainage of earth roads 1120
The mixing of concrete, E. McCullough 1121
Report of the [French] commission on alcohol 1121

MISCELLANEOUS.

Sixteenth Annual Report of Arizona Station, 1905 1121
Annual Report of Idaho Station, 1905 1121
Eighteenth Annual Report of Indiana Station, 1905 1121
Eighteenth Annual Report of Kansas Station, 1905 1121
Fourteenth Annual Report of Kentucky Station, 1901 1121
Fifteenth Annual Report of Kentucky Station, 1902 1122
Eighteenth Annual Report of Louisiana Stations, 1905 1122
Finances, meteorology, index 1122
Eighteenth Annual Report of Michigan Station, 1905 1122
Report of work at McNeill Branch Station, 1904, E. B. Ferris 1122
Eighteenth Annual Report of Vermont Station, 1905 1122
Abstract of Eighteenth Annual Report, 1905 1122
Crop Reporter 1122
Experiment Station Work, XXXIV 1122

LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Page.

Alabama Canebrake Station:
Bul. 23, Jan., 1906 1060
Arizona Station:
Sixteenth An. Rpt., 1905 . 1058, 1066, 1078, 1091, 1121
California Station:
Bul. 169, May, 1905 1063
Bul. 170, June, 1905 1089
Bul. 171, June 30, 1905 1051
Bul. 172, Jan., 1906 1081
Bul. 173, Dec. 31, 1905 1051
Bul. 174, Jan. 4, 1906 1110
Bul. 175, Jan., 1906 1082
Bul. 176, Jan. 30, 1906 1065
Connecticut State Station:
An. Rpt., 1905, pt. 2 1097
An. Rpt., 1905, pt. 3 1100
Georgia Station:
Bul. 69, Nov., 1905 1060
Bul. 70, Dec., 1905 1061
Bul. 71, Dec., 1905 1049
Hawaiian Sugar Planters' Station:
Div. Ent. Bul. 1, pts. 9, 10, introduction, Feb.–May, 1906. 1092
Idaho Station:
An. Rpt., 1905 ..... 1042, 1060, 1069, 1076, 1121
Illinois Station:
Bul. 106, Feb., 1906 1093
Indiana Station:
Bul. 111, Mar., 1906 1076
Eighteenth An. Rpt., 1905 . 1066, 1121
Kansas Station:
Bul. 132, Jan., 1906 1104
Eighteenth An. Rpt., 1905 .... 1056, 1119, 1121
Kentucky Station:
Fourteenth An. Rpt., 1901 .... 1041, 1042, 1121
Fifteenth An. Rpt., 1902 ..... 1041, 1042, 1122
Louisiana Stations:
Eighteenth An. Rpt., 1905 .... 1056, 1070, 1122
Maine Station:
Bul. 124, Dec., 1905 ..... 1042, 1122
Bul. 125, Feb., 1906 1066
Bul. 126, Feb., 1906 ..... 1050, 1058, 1059, 1063, 1068, 1080, 1102
Bul. 127, Mar., 1906 1051

Page.

Massachusetts Station:
Met. Buls., 207–208, Mar.–Apr., 1906 1043
Michigan Station:
Spec. Bul. 34, Mar., 1906 1060
Eighteenth An. Rpt., 1905 . 1043, 1122
Mississippi Station:
Bul. 87, Jan., 1905 .. 1055, 1066, 1122
Bul. 88, Jan., 1905 1056
New Jersey Stations:
Bul. 193, Mar. 14, 1906 1101
Bul. 194, Mar. 20, 1906 1094
New York Cornell Station:
Bul. 236, Feb., 1906 1083
Bul. 237, Mar., 1906 1059
North Dakota Station:
Bul. 68, Feb., 1906 1077
Oklahoma Station:
Bul. 70, Apr., 1906 1062
Pennsylvania Station:
Bul. 76, Feb., 1906 1057
Rhode Island Station:
Bul. 111, Feb., 1906 1063
South Dakota Station:
Bul. 94, Jan., 1906 1059
Bul. 95, Feb., 1906 1118
Vermont Station:
Bul. 117, Oct., 1905 1102
Bul. 118, Dec., 1905 1102
Bul. 119, Feb., 1906 1122
Bul. 120, Mar., 1906 1074
Bul. 121, Mar., 1906 1051
Bul. 122, Apr., 1906 1078
Spec. Bul., Apr., 1906 1094
Eighteenth An. Rpt., 1905 .... 1038, 1041, 1067, 1068, 1069, 1071, 1077, 1079, 1080, 1088, 1105, 1106, 1107, 1108, 1122
West Virginia Station:
Bul. 97, Dec. 31, 1905 1051
Rpt. Nursery Insp., etc., 1903–4 1091
Rpt. Nursery Insp., etc., 1904–5 1091

U. S. Department of Agriculture.

Bureau of Statistics:	
Crop Reporter, vol. 7, Nos. 11–12, Mar.–Apr., 1906	1122
Weather Bureau:	
Monthly Weather Review, vol. 34, Nos 1–2, Jan.–Feb., 1906 (20 cents per number, $2.50 per year)	1041, 1044, 1045
Library:	
Bul. 55 (40 cents)	1088

NOTE.—The publications of the United States Department of Agriculture, except those of the Weather Bureau, may be purchased from the Superintendent of Documents, Washington, D. C. For the publications of the Weather Bureau, requests and remittances should be directed to the Chief of the Bureau. The price of the Record is $1 per volume, or 10 cents per number. The prices of other technical publications are given in the list above. The publications of the State experiment stations are distributed from the stations and not from the Department.

EXPERIMENT STATION RECORD.

Editor: E. W. ALLEN, PH. D., *Assistant Director.*

EDITORIAL DEPARTMENTS.

Meteorology, Soils, and Fertilizers—W. H. BEAL.
Agricultural Botany and Vegetable Pathology—W. H. EVANS, Ph. D.
Field Crops—J. I. SCHULTE.
Horticulture and Forestry—C. B. SMITH.
Zootechny and Human Nutrition—C. F. LANGWORTHY, Ph. D.
Agrotechny, Dairy Farming, and Dairying—H. W. LAWSON.
Agricultural Chemistry—W. H. BEAL, C. F. LANGWORTHY, and H. W. LAWSON.
Economic Zoology, Entomology, and Veterinary Medicine—E. V. WILCOX, Ph. D.
Rural Engineering—R. P. TEELE.
Rural Economics—H. C. TAYLOR, Ph. D.
Agricultural Education—D. J. CROSBY.

CONTENTS OF VOL. XVII, NO. 12.

Page.

Editorial notes: Second session of Graduate School of Agriculture 1129
Recent work in agricultural science 1133
Notes 1203

SUBJECT LIST OF ABSTRACTS.

AGRICULTURAL CHEMISTRY.

Examination of materials important in agriculture, J. König 1133
New official Italian methods of analysis of fertilizers, L. Sicard 1133
Further note on the determination of phosphoric acid, V. Schenke 1133
Detection and determination of small quantities of iron, A. Mouneyrat 1133
Tables for use in nitrogen and protein determination, F. E. Hepner 1133
Determination of nitrogen in milk, M. Popp 1133
The laboratory book of dairy analysis, H. D. Richmond 1133
New rapid method for determination of fat in milk, N. Gerber 1134
The salt method, M. Siegfeld 1134
Importance of determining freezing point in milk analysis, A. A. Bonnema 1134
Detection of cocoanut oil in butter, A. W. Thorp 1134
Plant lecithin; a preliminary communication, E. Winterstein and O. Hiestand 1134
Experiments on amino acids, polypeptids, and proteids, E. Fischer 1134
Identification of sugar in mace and in cinnamon, E. Spaeth 1135
Estimating organic phosphoric acid in flour, C. Arragon 1135
Detection of sawdust in flour and bread, P. Paganini 1135
Brown deposit found on aluminium vessels, C. Formenti 1135

METEOROLOGY—WATER.

Report of the meteorological council 1135
Work of station of agricultural climatology of Juvisy, C. Flammarion 1135
Meteorological records for 1904 1135
Meteorological summary, C. B. Ridgaway 1136

Page.

Climate of Naples during meteorological year 1903–4, E. Annibale 1136
Rainfall régime and crops in Russia, H. Sagnier and E. Tisserand 1136
Weather forecasting 1136
Protection of crops against hail in 1905 by means of cannon and bombs, H. Dufour 1136
Construction of isobaric charts for high levels in atmosphere, J. W. Sandström. 1136
The gases of the atmosphere, W. Ramsay 1136
Water and its use for industrial and technical purposes, E. Leher 1136
Culture of anaerobic micro-organisms as applied to water analysis, A. Guillemard 1136
Use of copper sulphate in water filtration, H. W. Clark and S. DeM. Gage ... 1136
Bactericidal action of copper, H. W. Clark and S. DeM. Gage 1137
Resistance to decomposition of certain organic matters in sewage, H. W. Clark. 1137
Biological purification of sewage waters, Riche 1137
Recent views of the sewage disposal problem 1137
Present practice in sewage disposal 1138
Collection of samples of sewage for analysis, S. DeM. Gage and G. O. Adams. 1138

SOILS—FERTILIZERS.

Some new properties of soils, J. König, J. Hasenbäumer, and E. Coppenrath. 1138
Study of rock decomposition under action of water, A. S. Cushman 1138
Absorption of potassium by soils, O. Schreiner and G. H. Failyer 1139
Absorption of phosphate by soils, O. Schreiner and G. H. Failyer 1139
Absorption of phosphates and potassium by soils, O. Schreiner and G. H. Failyer 1139
Solubility of phosphoric acid in sugar-beet soils, J. Stoklasa 1140
Improvement of soil relatively deficient in magnesia, T. Nakamura 1140
Meeting of fertilizer section of German Agricultural Society 1140
The sale of sheep manure, F. de Barrau 1140
Fertilizers on cereal crops grown in rotation, C. E. Thorne 1141
Inoculation of leguminous plants 1141
The fixation of atmospheric nitrogen 1142
Fixation of atmospheric nitrogen, P. A. Guye 1142
The fixation of atmospheric nitrogen 1142
Utilization of atmospheric nitrogen, W. Löb 1142
The manufacture of nitric acid at Notodden, L. Grandeau 1142
Factory at Notodden, Norway, for manufacture of nitrate, L. Grandeau 1142
Electric furnace of Birkeland and Eyde, L. Grandeau 1142
Calcium cyanamid 1142
Nitrogen and nitrogenous fertilizers, P. G. Wicken 1142
Production of nitrate, R. E. Mansfield 1142
Use of ammoniacal gas liquor as a fertilizer, C. Dusserre 1143
Bone products, J. C. McNally 1143
Phosphate rock production, E. O. Hovey 1143
Potash as a fertilizer, P. G. Wicken 1143
Analyses of commercial fertilizers, M. A. Scovell et al 1143
Analyses of fertilizers, C. A. Goessmann 1143
Analyses of fertilizers and insecticides, C. A. Goessmann 1143
Analyses of commercial fertilizers, P. Schweitzer and R. M. Bird 1144
Analyses of commercial fertilizers, P. Schweitzer and R. M. Bird 1144
Commercial fertilizers, W. W. Miller and N. W. Lord 1144
Licensed commercial fertilizers, 1906, F. W. Woll and G. A. Olson 1144
Fertilizers in Japan 1144
Artificial fertilizers, P. G. Wicken 1144

AGRICULTURAL BOTANY.

Plant breeding, L. H. Bailey 1144
Correlation between calcium salts and assimilation of nitrate, V. V. Yermakov. 1144
Morphology and biology of nitrogen-assimilating organisms, L. Lutz 1145
Effect of differences in solar radiations on transfer of albuminoids, J. Dumont. 1145
Changes produced in tropical plants by change of environment, D. Bois and I. Gallaud 1146
Wound stimuli, parasitism, and gum flow, M. W. Beijerinck and A. Rant 1146
Some experiments in control of color in plants, H. Kraemer 1146
Factors concerned in color production in Fusarium, J. B. Pollock 1146
Induction of new species, D. T. MacDougal 1147

FIELD CROPS.

	Page.
Report of the agriculturist, B. C. Buffum	1147
Report of cooperative grass and forage plants experiments, A. H. Danielson	1147
Succotash as a soiling crop, R. S. Shaw	1147
[Experiments at experiment station at Vienna, 1905], O. Reitmair	1148
Fertilizer experiments on meadows, A. Grete	1148
Some suggestions relative to alfalfa growing in Ohio, C. G. Williams	1148
Alfalfa seed, H. F. Roberts and G. F. Freeman	1148
Correction of unfavorable ratio of lime to magnesia for barley, G. Daikuhara	1149
Buckwheat, J. L. Stone	1149
Buckwheat, E. Haselhoff	1149
The cassava industry, L. Colson and L. Chatel	1149
Adulteration of red clover seed, J. Wilson	1149
Corn, W. H. Scherffius	1149
Experiments with corn, C. G. Williams	1150
Cooperative fertilizer experiments with cotton, J. F. Duggar	1150
Great millet or sorghum in Madras, C. Benson and C. K. Subba Rao	1150
Four-year culture tests with oats, 1901–1904, W. Edler	1150
A preliminary report on growing Irish potatoes, C. M. Conner	1151
Some results of potato investigations in 1905, T. C. Johnson	1151
Rough skin in relation to starch content of potatoes, R. Krzymowski	1151
Application of magnesium sulphate for rice plant, G. Daikuhara	1151
Anatomical structure of stems of spring rye, P. Vageler	1152
Experiments with sugar beet, G. Clarke	1152
Seedling canes and manurial experiments, J. P. d'Albuquerque and J. R. Bovell	1152
Report on experiments with varieties of swedes, 1902–1905, W. Allan	1153
Lime factor for the tobacco plant, G. Daikuhara	1153
Results of seed tests at the German seed control stations	1153
Report of seed control station at Vienna for 1905, T. von Weinzierl	1153
Studies of weeds. I, Some common thistles, J. Percival	1153

HORTICULTURE.

Pineapple culture. III, Fertilizer experiments, H. K. Miller and A. W. Blair	1154
Pineapple culture. IV, Handling the crop, H. H. Hume	1155
The mango in Hawaii, J. E. Higgins	1155
Vegetable novelties, F. W. Rane and H. F. Hall	1155
Horticultural division, G. S. Scott	1155
Flower biology and productiveness of fruit trees, Ewert	1156
Fruits and other food products of Jamaica, E. J. Wortley	1156
Influence of colored light on the preservation of ripe fruit	1156
Orchard notes, W. M. Munson	1156
The apples of New York, II, S. A. Beach, N. O. Booth, and O. M. Taylor	1157
Apple districts of New York with varieties for each, U. P. Hedrick et al	1157
Peach and plum culture, A. B. McKay	1157
Peaches for home and market, W. J. Green and F. H. Ballou	1158
Varieties of strawberries and cultural directions, O. M. Taylor	1158
Strawberries, O. M. Taylor	1158
Marketing strawberries	1158
Longevity of grapes in north Texas, T. V. Munson	1158
Varieties and species of cultivated cacao, M. A. Fauchère	1158
Second report on pecan culture, H. H. Hume	1158
All the spireas worth growing, J. Dunbar	1159
The American carnation, A. Hemsley	1159
Experiments on inheritance in sweet peas and stocks, W. Bateson et al	1159

FORESTRY.

Forestry work of Ohio Experiment Station, W. J. Green and C. W. Waid	1159
Forest planting in sand-hill region of Nebraska, G. Pinchot	1159
Review of forest administration in British India, S. Eardley-Wilmot	1160
How shall forests be taxed? A. Gaskill	1160
Kealia forest reserve	1160
Ewa forest reserve	1160

Page.
The black wattle in Hawaii, J. G. Smith 1160
How to prune young locust and catalpa trees, W. J. Green and C. W. Waid .. 1161
Northern limit of the papaw tree, C. A. White 1162
Packing seeds for the Tropics, J. H. Hart 1162
Suitability of New South Wales timbers for railway construction 1162
Report on the turpentine industry in the United States, Bell 1162

DISEASES OF PLANTS.

Notes on miscellaneous diseases, K. Malkoff 1162
Laboratory notes, T. W. Kirk 1162
Contribution to life history of some Uredineæ, E. Fischer 1162
Investigations on stinking smut of wheat and its control, K. Malkoff 1162
Investigations on mosaic disease of tobacco, F. W. T. Hunger 1163
Combating the mosaic disease of tobacco, H. Jensen 1163
Potato diseases, T. W. Kirk 1163
Note on facultative saprophytism of *Alternaria solani*, A. H. Cockayne 1163
Heart rot of beets, mangels, and Swedish turnips 1164
The drop disease of cabbage, J. Ritzema Bos 1164
Three fungus diseases of the cultivated ginseng, H. S. Reed 1164
A Phytophthora rot of apples, etc., A. Osterwalder 1165
Notes on so-called closed canker of apple trees, K. von Tubeuf 1165
Bacterial disease of cherry trees, R. Aderhold and W. Ruhland 1165
Observations on biology of olive-tubercle organism, E. F. Smith 1165
Investigations on olive tuberculosis, R. Schiff 1166
Occurrence and prevention of gooseberry mildew, R. Ewert 1166
American mildew of gooseberries, J. Ritzema Bos 1166
Further investigations on bacterial disease of sesame, K. Malkoff 1166
Concerning witches brooms of pear trees, F. Muth 1166
Witches brooms of *Quercus rubra*, Solereder 1166
Witches brooms of fir trees, K. von Tubeuf 1167
Notes on *Thelephora laciniata*, K. von Tubeuf 1167
Studies on Melampsora occurring on willows in Switzerland, O. Schneider ... 1167
Occurrence of timber dry rot in Russia, L. von Lubimoff 1167
A sclerotium disease of Forsythia, A. Osterwalder 1167
Resistance of various varieties of roses to rust, R. Ewert 1167
A competitive test of spraying apparatus, J. Ritzema Bos 1167

ECONOMIC ZOOLOGY—ENTOMOLOGY.

Bark ringing by woodpeckers and its relation to forest insects, G. Fuchs 1168
The pine squirrel as a forest pest, Rudolf Koch 1168
Loss of terminal twigs through agency of pine squirrels, K. von Tubeuf 1168
Bark injury due to pine squirrel (*Sciurus vulgaris*), K. Eppner 1168
Determination of generic types, and list of roundworm genera, C. W. Stiles and A. Hassall 1168
The synonymy of Tænia, etc., C. W. Stiles and E. C. Stevenson 1168
International catalogue of scientific literature. N—Zoology 1168
Fauna of British India, including Ceylon and Burma, C. T. Bingham 1168
Report of the entomologist, C. P. Gillette 1169
Dangerous insects and diseases and their treatment, L. R. Taft 1169
Insect pests in West Australian orchards and vineyards, F. Lowe 1169
Preliminary list of more injurious insects of Texas, with notes on distribution. 1169
Entomological notes, J. Kotinsky 1169
Yearly programme in entomological practice for orchard, H. A. Gossard 1169
Spraying calendar, S. A. Beach and E. E. Little 1169
The mealie stalk borer, C. W. Mally 1169
Preservation of maize during transport by Clayton process 1170
Control of micro-lepidoptera injurious to grapes in France, J. Dewitz 1170
Combating phylloxera in 1904, D. Cavazza 1170
The grape phylloxera in Hesse, W. Schuster 1170
Natural enemies of the fruit fly, C. P. Lounsbury 1170
In search of parasites, G. Compere 1171
Some tree and wood-infesting insects. Cabbage snakes, H. Garman 1171
The black locust tree and its despoliation, C. A. White 1171
The root-louse of the Norway spruce, A. Jacobi 1171
The number of annual generations among the bark beetles, E. Knoche 1172

Page.
Tomicus typographus, O. Nüsslin 1172
Pissodes harcyniæ, G. Fuchs 1172
Lophyrus similis, W. Baer 1172
Progress made in exterminating the fever tick in North Carolina, T. Butler... 1172
Fowl tick experiments, F. H. Robertson 1172
Classification of mosquitoes of North and Middle America, D. W. Coquillett .. 1173
Household insects, W. Lochhead 1173
Report of the committee on apiary, J. W. Nelson..... 1173
Apiculture in Cuba, E. W. Halstead 1173
Age at which bees first carry pollen, C. C. Miller 1173
Japan's three silk crops, F. A. Vivanti..... 1173
Emaciation and flaccidity of the silkworm, S. Sartirana 1173

FOODS—HUMAN NUTRITION.

Food and diet in health and disease, R. F. Williams..... 1174
A new method of indicating food values, I. Fisher..... 1174
Extent of underfeeding amongst school children of Blackburn, A. Greenwood. 1174
Function of cellulose in diet of man, I, H. Lohrisch 1174
Influence of dietary on constituents of urine, A. Desgrez and J. Ayrignac 1174
Effect on metabolism of overfeeding protein, M. Schreuer..... 1175
Protein feeding and the estimation of glycogen, E. Pflüger..... 1175
Some considerations on proteid diet, L. F. Barker and B. A. Cohoe..... 1175
Study of proteids of beef flesh, P. F. Trowbridge and H. S. Grindley..... 1175
The globulin of muscle fibers, L. Morochowetz..... 1175
The globulin of egg yolk, L. Morochowetz 1176
The liver as a storehouse for protein, W. Seitz..... 1176
Effect of constituents of low-grade flour on extraction of gluten, Lindet and L. Ammann..... 1176
The acidity of bread and its causes, H. Stiegeler..... 1176
Nutritive value of Corsican chestnut flour, P. Comte..... 1176
Study of apple marc, W. D. Bigelow and H. C. Gore 1176
Changes in composition of fruit of cucurbits, Leclerc du Sablon..... 1176
Chemistry of celery (*Apium graveolens*), I, M. Bamberger and A. Landsiedl .. 1177
Absorption of sulphurous acid from the air by meat, A. Kickton 1177
Evaporated cream..... 1177
The artificial coloring of mustard, P. Köpcke..... 1177
Honey vinegar, J. J. Hofmann..... 1177
Report of work in food and drug laboratory, H. E. Barnard and J. N. Hurty. 1177
Pure food and drug laws of State of Indiana..... 1177
The pure food law in Germany, A. Juckenack..... 1177

ANIMAL PRODUCTION.

Composition of some Hawaiian feeding stuffs, E. C. Shorey 1177
Analysis of fodder plants, E. A. Mann 1178
Feeding-stuff inspection, C. D. Woods and J. M. Bartlett 1178
Inspection of concentrates, J. B. Lindsey et al..... 1178
The inspection of feeding stuffs in 1905, F. W. Morse 1179
Licensed concentrated feeding stuffs, F. W. Woll and G. A. Olson..... 1179
Nutritive value of nonproteid nitrogen compounds, E. Schulze 1179
Value of asparagin and lactic acid in feeding of Herbivora, O. Kellner 1179
Digestion experiments with forage plants, H. G. Knight 1179
Feeding beef cattle in Mississippi, A. Smith and C. I. Bray 1179
Summary of swine feeding, 1904–5, G. E. Morton..... 1180
Supplements to corn for fattening hogs, E. B. Forbes 1181
The poultry industry in Tasmania, R. J. Terry..... 1182

DAIRY FARMING—DAIRYING—AGROTECHNY.

Profitable dairying, C. L. Peck..... 1182
Breed, individuality, and heredity in production of milk, M. Fischer 1182
A test of a fly repellent, C. H. Eckles..... 1182
Milking machines, P. G. Wicken..... 1182
The composition of milk, H. D. Richmond..... 1182
Milk supply of Boston, New York, and Philadelphia, G. M. Whitaker..... 1183

Page.
Influence of milk control upon composition of milk in Gratz, K. Helle 1183
Rapidity of absorption of odors by milk, F. Bordas and Toutplain 1183
Study of bacterial content of milk and of the udder, R. d'Heil 1183
Contamination of milk at the dairy, A. H. Stewart 1183
Frequency of streptococci in milk, M. Kaiser 1183
On the streptococci of milk, P. T. Müller 1183
Reduction test as means of determining freshness of milk, P. T. Müller 1184
The testing of market milk, A. Lam 1184
Care of composite milk samples, I. C. Weld 1185
Combination of lactic acid with casein in lactic fermentation, C. Richet 1185
A test of tin can separators, C. H. Eckles 1185
Creamery problems, C. L. Beach 1185
Creamery cold storage, J. A. Ruddick 1185
Manufacture of whey butter at Swiss cheese factories, E. H. Farrington 1186
Some facts about moisture and its effects on butter, G. L. McKay 1186
Composition of Dutch butter made in creameries under state control, T. van Sillevoldt 1186
Bacteriological examinations of the butter of Stuttgart, A. Reitz 1186
Fungi in cheese ripening: Camembert and Roquefort, C. Thom 1186
A new method of making dry red wine, F. T. Bioletti 1187
The artificial ripening of grapes, L. Mathieu 1187

VETERINARY MEDICINE.

Proceedings of the American Veterinary Medical Association 1188
Annual report of State board of live stock commissioners of Ohio, P. Fischer 1189
Work in laboratory of veterinary physiology and pharmacology, P. A. Fish et al 1189
Bang method, with illustration of application, H. A. Harding et al 1189
Healthy herd from tuberculous herd, F. H. Hall et al 1190
Combating tuberculosis in farm animals, A. Van Leeuwen 1190
Distribution of tuberculosis in Wisconsin, H. L. Russell and E. G. Hastings 1190
Are tubercle bacilli coughed up by cattle? J. A. Klauners 1190
Serum vaccination against anthrax, G. Gazzaniga 1190
Blackleg, W. H. Dalrymple 1190
Vaccination against blackleg, K. R. Kuipers 1190
Texas fever with methods for its prevention, J. R. Mohler 1190
Vaccination against foot-and-mouth disease, N. L. Buonsanti 1191
Treatment of epizootic abortion, E. Thierry 1191
The poisoning of cattle by tobacco decoction, F. Peuch 1191
Vaccination for hog cholera, L. Brusasco 1191
Combating swine plague, Foth 1191
Antidotes for poisoning by *Gastrolobium calycinum*, E. A. Mann 1191
Suggestions as to dipping sheep 1192
Infectious broncho-pneumonia of lambs, E. Thierry 1192
Notes on pathogenic organism of pneumonia and its biology, Lorenz 1192
Demonstration of organism of pneumonia in horses and its biology, Lorenz 1192
Pleuro-pneumonia, Mouquet 1192
Contagious coryza, with especial reference to immunization of rabbits, J. Ludwig 1192
Experiments in protective inoculation against contagious coryza, T. Kitt 1193
Kimberley disease in horses, R. E. Weir et al 1193
A skin disease in horses affecting only the white markings, E. E. Martin 1193
Osteomalacia in Tonquin, J. Sourrel 1193
Use of artificial impregnator in horse breeding, L. L. Lewis and W. L. English 1193
Effect of experimental epilepsy on poisoning by tetanus toxin, L. Cesari 1194
Treatment of demodectic mange, Cedéac 1194
Bacillus of mouse typhoid and related forms, R. Trommsdorf 1194

RURAL ENGINEERING.

Irrigation from Snake River, Idaho, H. G. Raschbacher 1194
Results of experiments on irrigated meadows, Tacke 1195
Irrigated lands in Idaho 1195
[Irrigation in Wyoming] 1195
Method and cost of constructing cement pipe in place, H. P. Gillette 1195

Page.
Investigation of ancient hydraulic works in Algeria, S. Gsell 1196
Strainers for driven wells, D. H. Maury 1196
Mountain road construction in Idaho, E. B. Darlington 1196
Road maintenance, R. A. Meeker 1196

RURAL ECONOMICS.

Depreciation in agricultural values, P. Caziot 1196
Report on operation of agricultural insurance societies, A. de Céris 1197
Loans of Credit Foncier for agricultural enterprises, A. de Céris 1197
Meat in foreign markets 1197
Meat animals and packing-house products imported into eleven countries, 1895–1904 1197
Norway, Sweden, and Russia as markets for packing-house products 1197
Cotton production and statistics of cotton-seed products, 1905 1197
Introduction to history of sugar as a commodity, Ellen D. Ellis 1198

AGRICULTURAL EDUCATION.

Higher agricultural education, E. A. Bryan 1198
Educational agriculture, W. R. Hart 1198
How can a college of agriculture keep close to the ground? L. H. Bailey 1198
Convention of Association of American Agricultural Colleges and Experiment Stations 1198
Tenth annual meeting of American Association of Farmers' Institute Workers. 1198
Animal husbandry—four-year course, R. S. Shaw 1198
Course in cheese making for movable schools of agriculture, L. L. Van Slyke. 1199
Syllabus for a four-year course in horticulture, U. P. Hedrick 1199
Teaching horticulture in high schools 1199
Topics in horticulture for common schools, U. P. Hedrick 1199
Outline for a brief course in agricultural economics, K. L. Butterfield 1199
Outline for a brief course in rural sociology, K. L. Butterfield 1199
Outline for a course in farm management, F. W. Card 1199
Teaching agricultural economics in the agricultural high schools, E. Vliebergh. 1199
How to determine what to teach in nature study, L. A. Hatch 1199
Nature study in its practical bearings, J. P. Stewart 1199
The relation of nature study to manual training, W. A. Baldwin 1200
Experience in school gardening, J. B. Dandeno 1200
The school garden at Bowesville, Canada, E. A. Howes 1200
Preparation of teachers for the rural common schools, E. Burnham 1200
The school garden and the country school, G. D. Fuller 1200
True nature study: Its fundamentals and relation to some other subjects, J. V. Crone 1200
Nature study and gardening, Estelle Reel 1200
Education in Indian rural schools. A plea for nature study, F. G. Sly 1200
Royal Hungarian Central Viticultural Institute 1200
Agricultural education in India, J. Harward 1201
Schools for colonial agriculture, Reinecke 1201

MISCELLANEOUS.

Fourteenth Annual Report of Colorado Station, 1901 1201
Report of Florida Station, 1903 1201
Report of Florida Station, 1904 1201
Seventeenth Annual Report of Illinois Station, 1904 1201
Twentieth Annual Report of Maine Station, 1904 1201
Twenty-first Annual Report of Maine Station, 1905 1201
Fourteenth Annual Report of New Mexico Station, 1903 1201
Twenty-third Annual Report of the New York State Station, 1904 1201
Ohio Agricultural Experiment Station 1201
Fifteenth Annual Report of Wyoming Station, 1905 1202
Report of the Secretary of Agriculture, 1905, James Wilson 1202
Publications of Office of Experiment Stations issued during 1905 1202
Accessions to the Department Library, 1906 1202

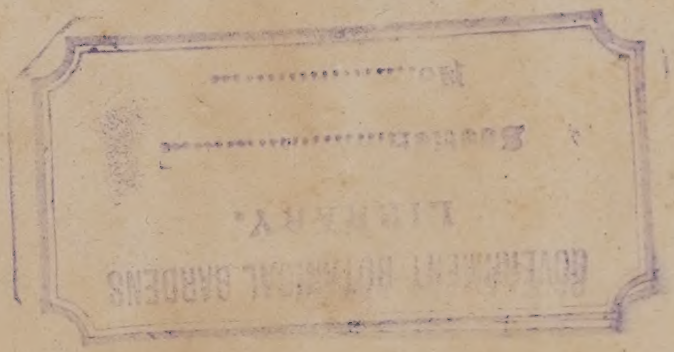
LIST OF EXPERIMENT STATION AND DEPARTMENT PUBLICATIONS REVIEWED.

Stations in the United States.

Alabama College Station: Page.
Bul. 131, Feb., 1905 1150
California Station:
Bul. 177, Feb., 1906 1187
Colorado Station:
Fourteenth An. Rpt., 1901 ... 1147, 1169, 1201
Connecticut Storrs Station:
Bul. 40, Apr., 1906 1185
Florida Station:
Bul. 82, Dec., 1905 1151
Bul. 83, Feb., 1906 1154
Bul. 84, Mar., 1906 1155
Bul. 85, Mar., 1906 1158
An. Rpt., 1903 1201
An. Rpt., 1904 1201
Hawaii Station:
Bul. 11, 1906 (10 cents) 1160
Bul. 12, 1906 (10 cents) 1155
Bul. 13, 1906 (10 cents) 1177
Illinois Station:
Seventeenth An. Rpt., 1904 .. 1201
Iowa Station:
Bul. 85, Apr., 1906 1169
Kansas Station:
Bul. 133, Feb., 1906 1148
Kentucky Station:
Bul. 120, May, 1905 1171
Bul. 121, Aug., 1905 1143
Bul. 122, Dec., 1905 1149
Louisiana Stations:
Bul. 85, Mar., 1906 1190
Maine Station:
Bul. 128, Mar., 1906 1156
Bul. 129, Apr., 1906 1178
Twentieth An. Rpt., 1904 1201
Twenty-first An. Rpt., 1905 .. 1201
Massachusetts Station:
Bul. 107, Dec., 1905 1143
Bul. 108, Jan., 1906 1178
Bul. 109, Mar., 1906 1143
Michigan Station:
Bul. 235, Feb., 1906 1147
Mississippi Station:
Bul. 92, Aug., 1905 1179
Bul. 93, Sept., 1905 1157
Missouri Station:
Bul. 66, Dec., 1904 1144
Bul. 67, Apr., 1905 1181
Bul. 68, July, 1905 ..... 1182, 1185
Bul. 69, Oct., 1905 1164
Bul. 70, Dec., 1905 1144
New Hampshire Station:
Bul. 124, Mar., 1906 1179
Bul. 125, Mar., 1906 1155
Bul. 126, Apr., 1906 1185
New Mexico Station:
Fourteenth An. Rpt., 1903 ... 1201

Stations in the United States—Cont'd.

New York Cornell Station: Page.
Bul. 238, Apr., 1906 1149
New York State Station:
Bul. 275, Apr., 1906 1157
Bul. 276, Apr., 1906 1158
Bul. 277, Apr., 1906 ..... 1189, 1190
Twenty-second An. Rpt., 1903, pt. 2 1157
Twenty-third An. Rpt., 1904 .. 1135, 1201
Ohio Station:
Bul. 170, Feb., 1906 1158
Circ. 48, Jan. 2, 1906 1201
Circ. 49, Feb. 1, 1906 1148
Circ. 50, Feb. 2, 1906 1159
Circ. 51, Feb. 28, 1906 1161
Circ. 52, Mar. 1, 1906 1169
Circ. 53, Mar. 28, 1906 1150
Circ. 54, Apr. 14, 1906 1141
Oklahoma Station:
Circ. 5, Mar., 1906 1193
Wisconsin Station:
Bul. 132, Dec., 1905 1186
Bul. 133, Feb., 1906 1190
Bul. 134, Apr., 1906 ..... 1144, 1179
Wyoming Station:
Fifteenth An. Rpt., 1905 ..... 1133, 1136, 1179, 1180, 1202

U. S. Department of Agriculture.


Circ. 18 1149
Rpt. 81 (10 cents) 1202
Bureau of Animal Industry:
Bul. 78 (10 cents) 1190
Bul. 79 (5 cents) 1168
Bul. 80 (5 cents) 1168
